

Georges A. de Boccard, M.D.

Consultant Urologist F.E.B.U.

*Sexual function
and dysfunction in men*

Training in Reproductive Health Research
Geneva Foundation for Medical Education and Research
Geneva March 15th, 2007.

**The physical
Pathways of a
Normal erection?**

After erotical stimulation

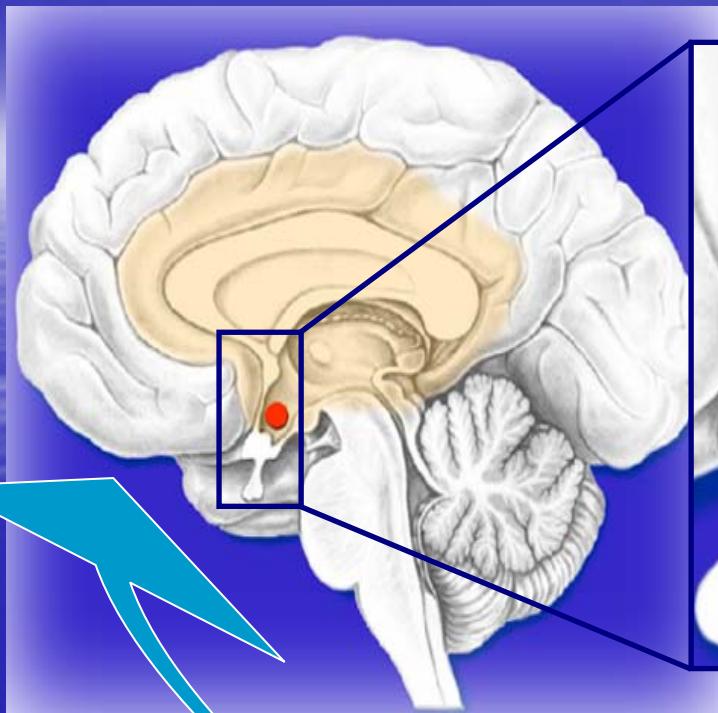

And physical stimulation

visual

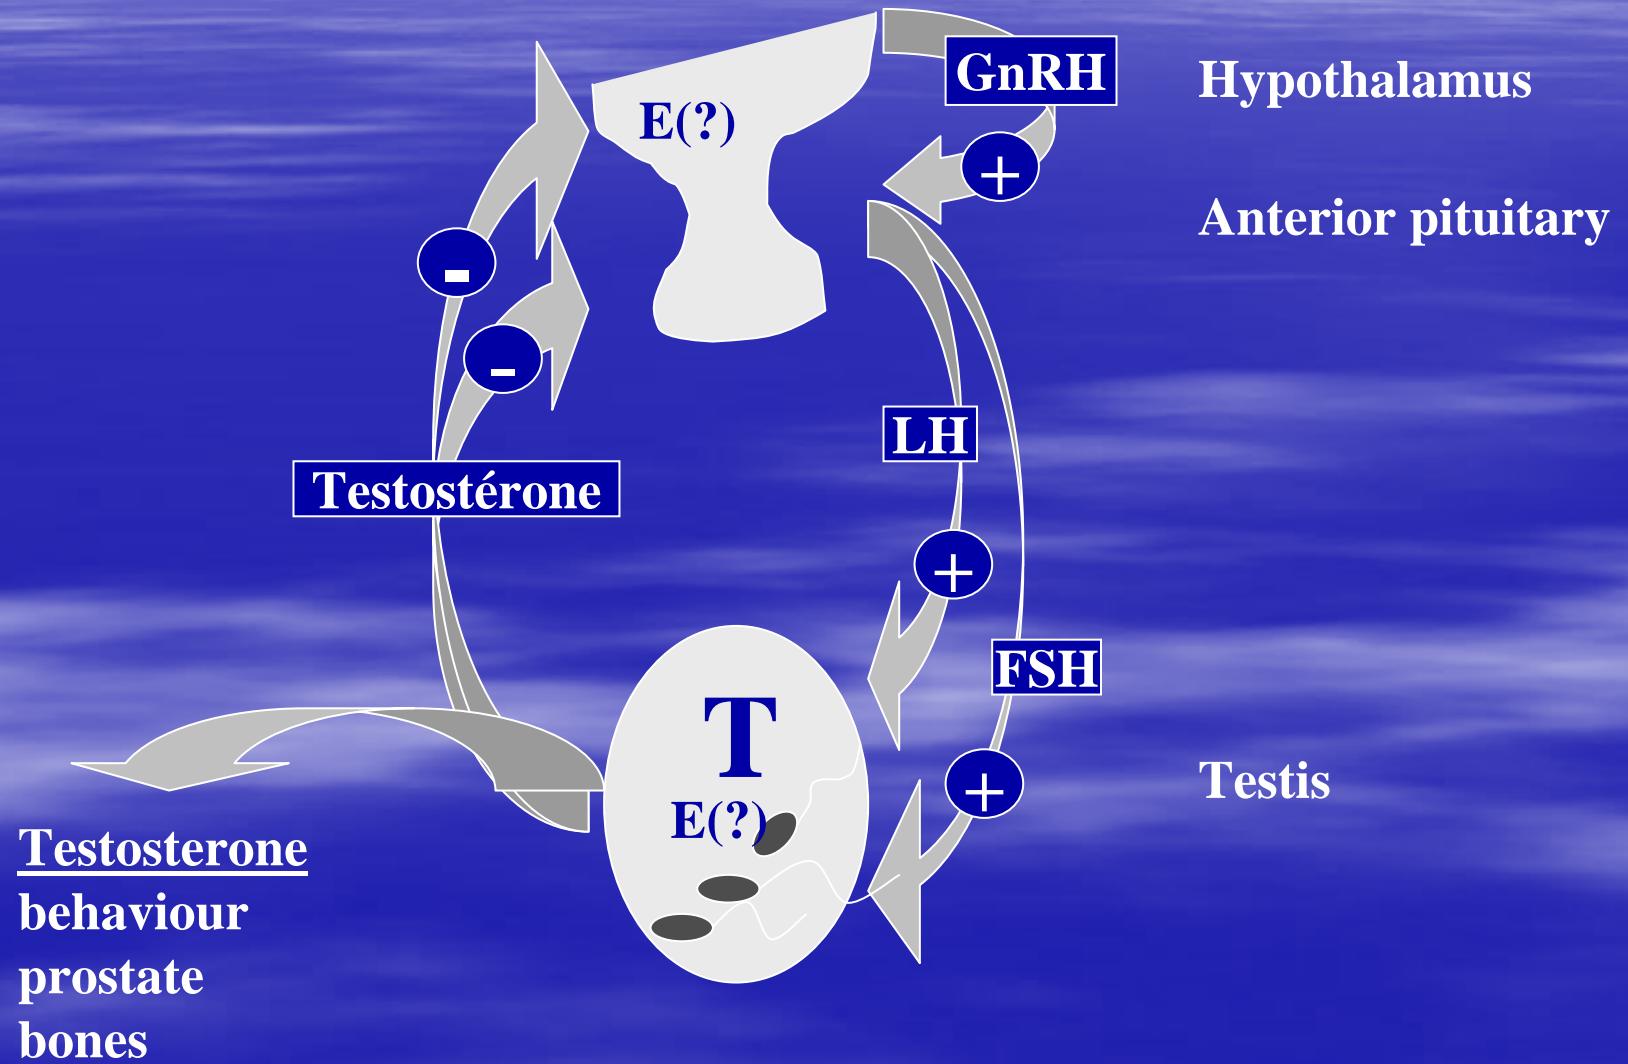

tactile

genital

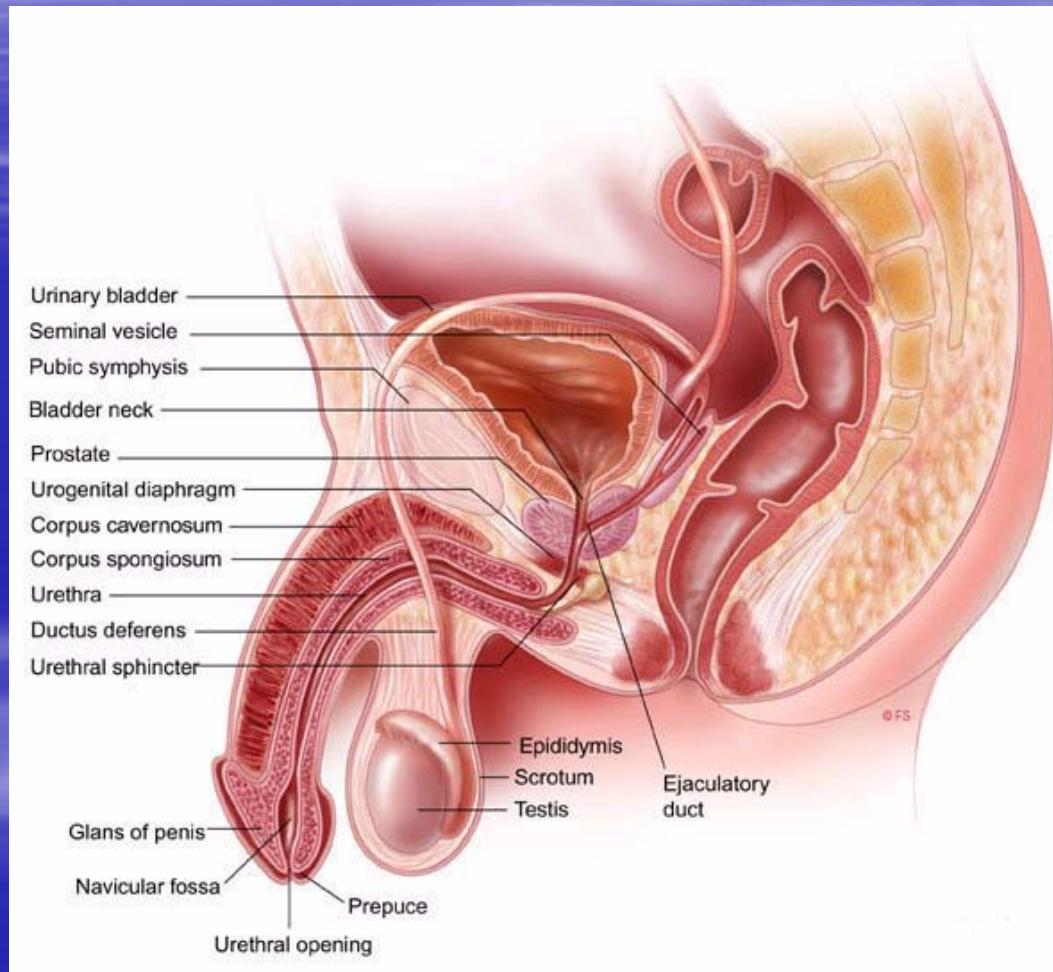

1. Anatomy and physiology of normal erection
2. Incidence of erectile dysfunctions
3. Causes of erectile dysfunctions
4. Diagnostic tools
5. Treatments

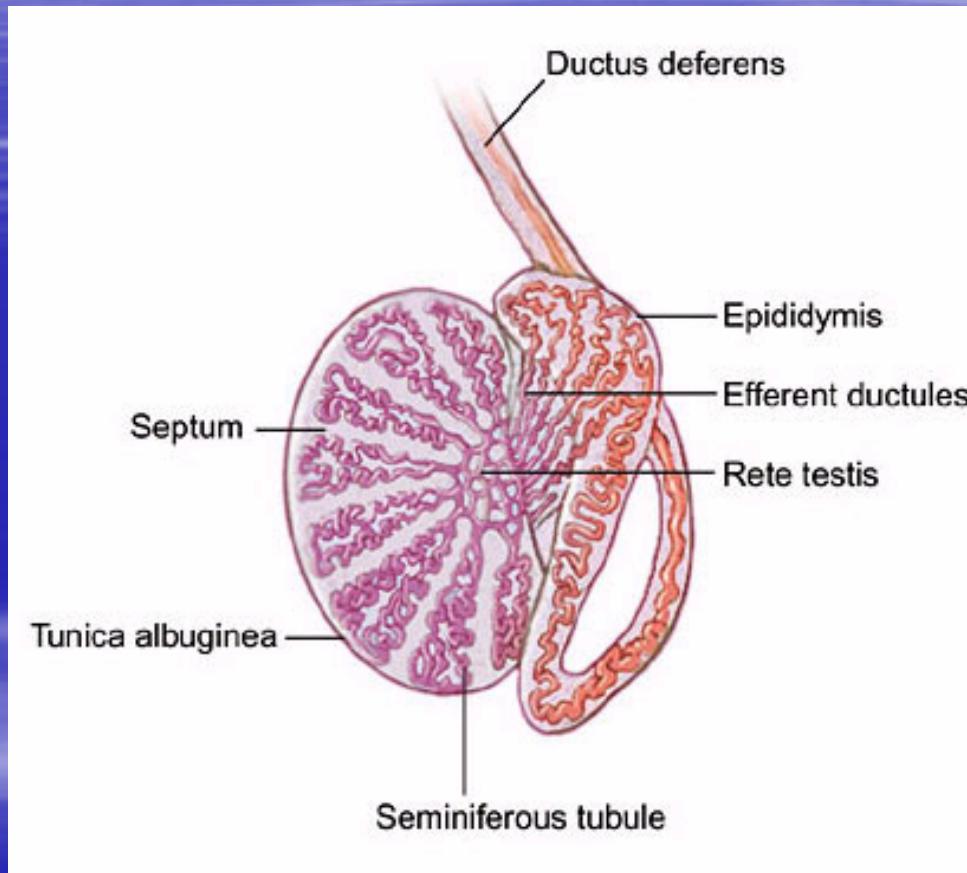

Pituitary & gonadic physiology

Anatomy

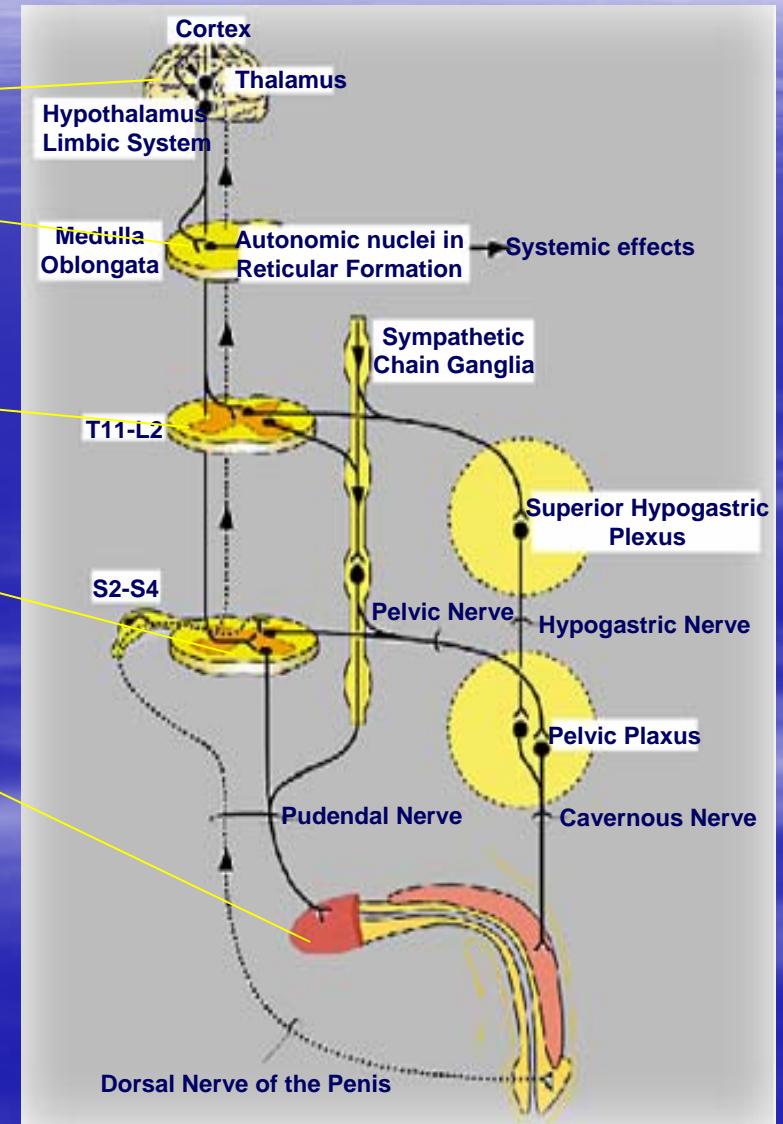

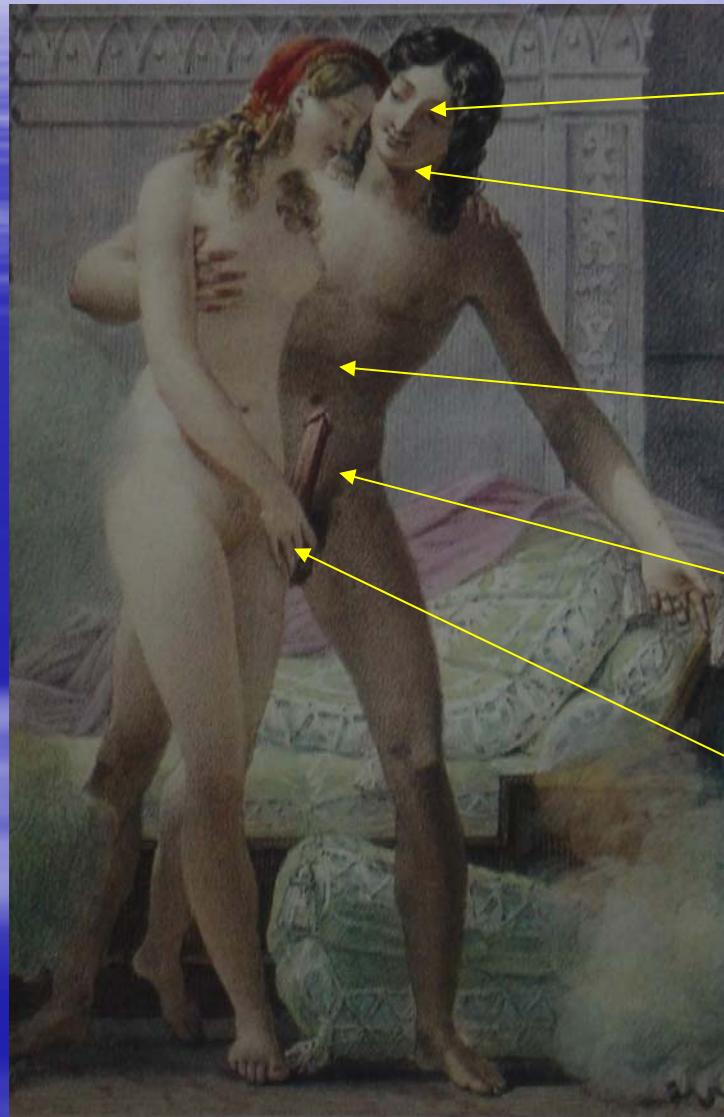

Anatomy

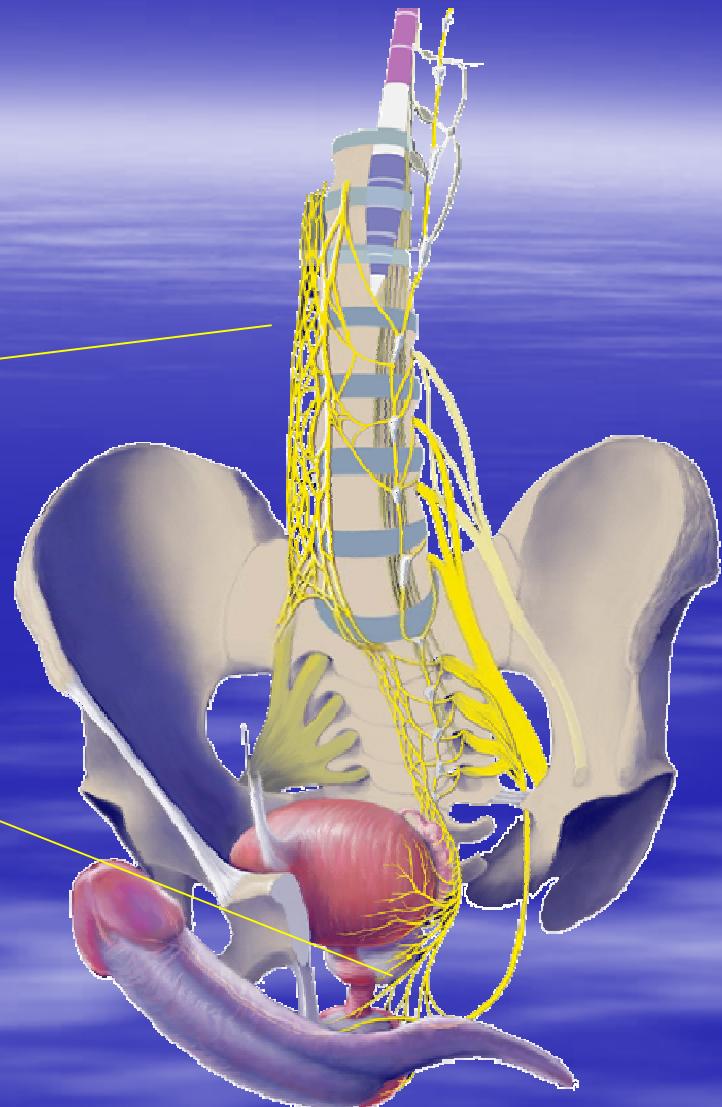

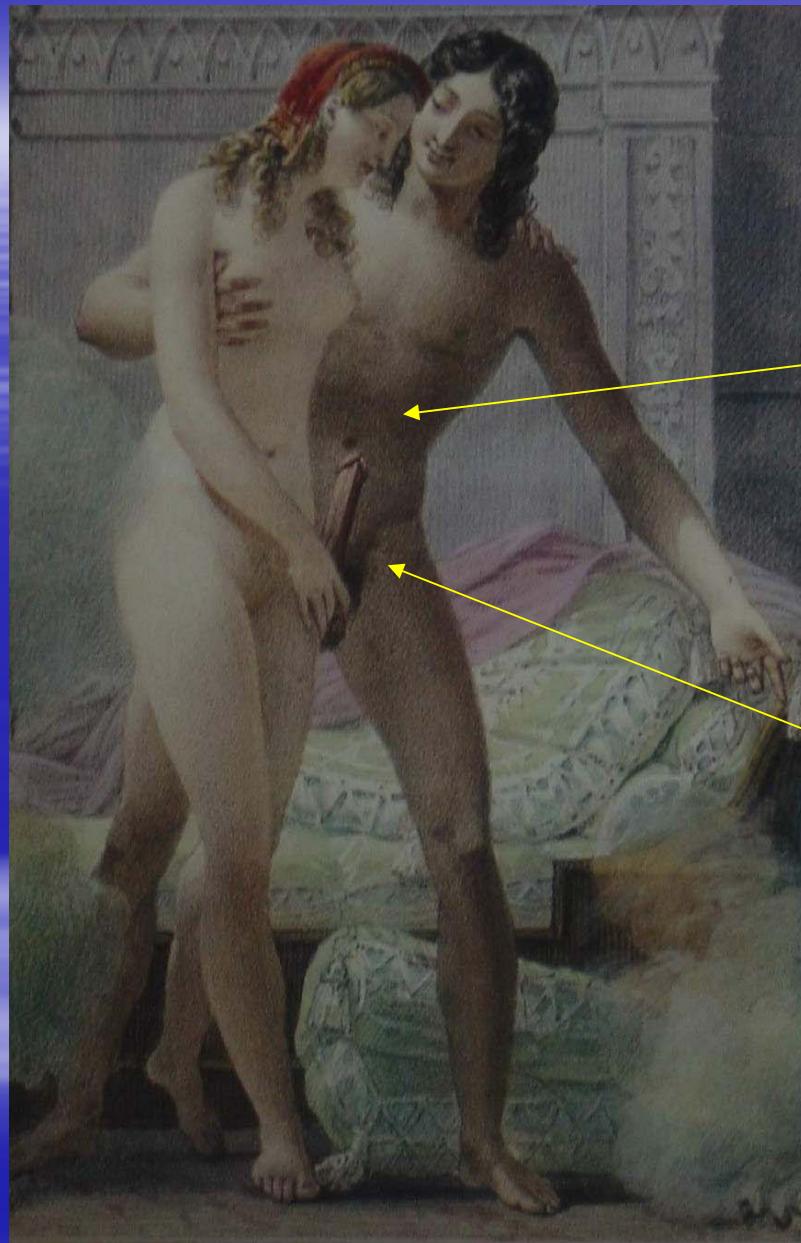

Neurophysiology

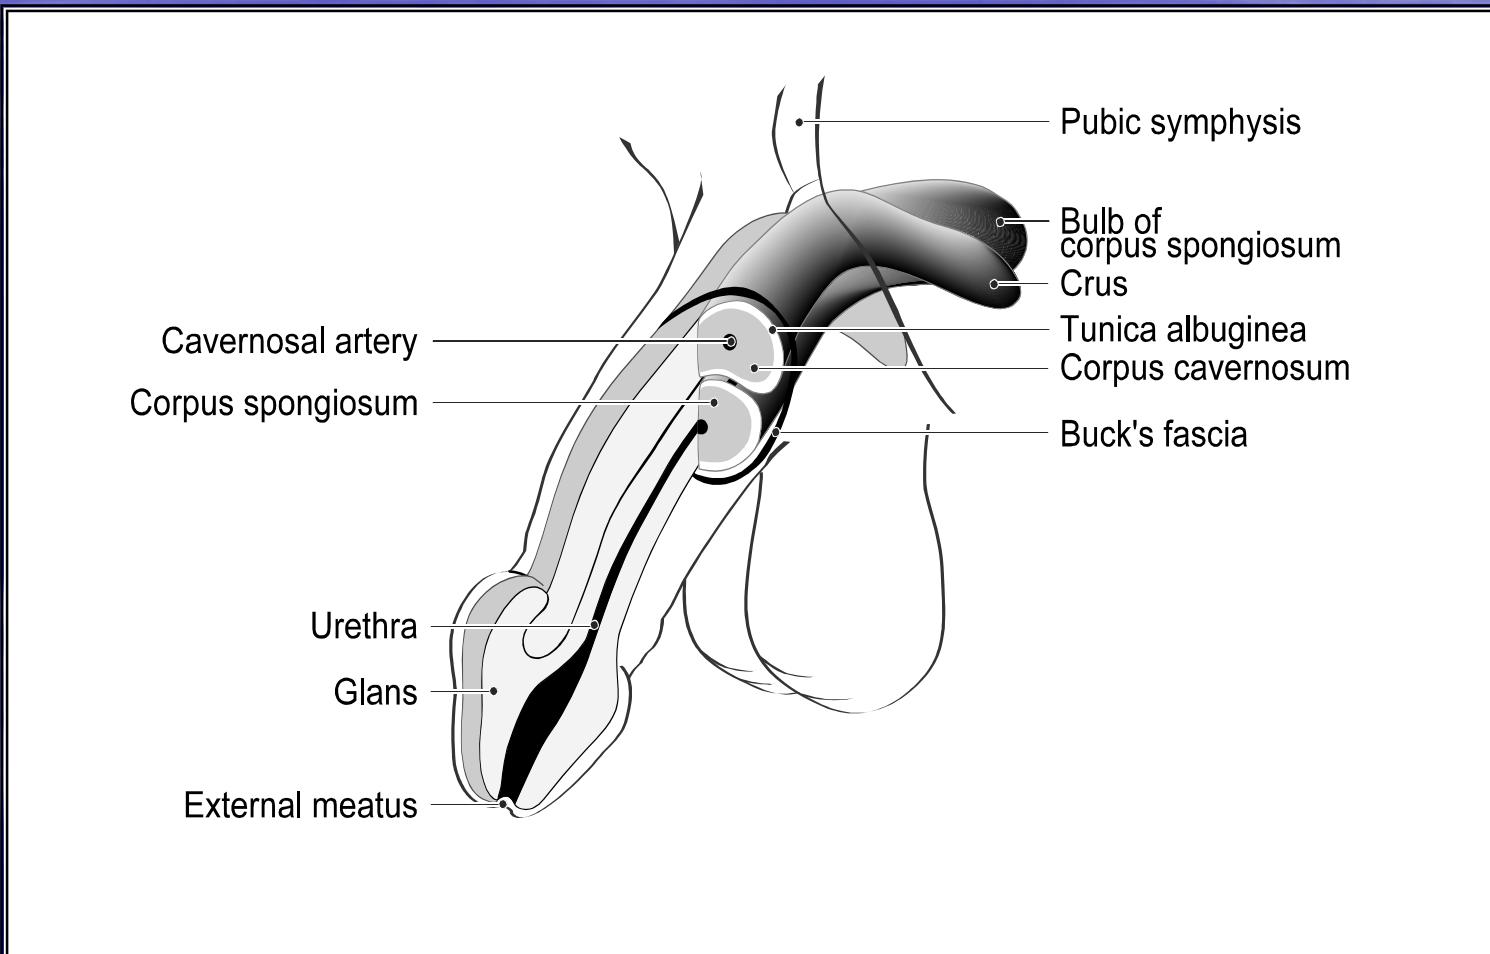

- **cavernous Nerves**
 - Parasympathetic nitrergic
 - Sympathetic adrenergic
 - control of the blood flow (rigidity- flaccidity)
- **Pudendal Nerves**
 - Sensitive (positive feed-back)
 - motors : contraction of perineal muscles (ischio- and bulbocavernous)

Functional neuroanatomy of erection

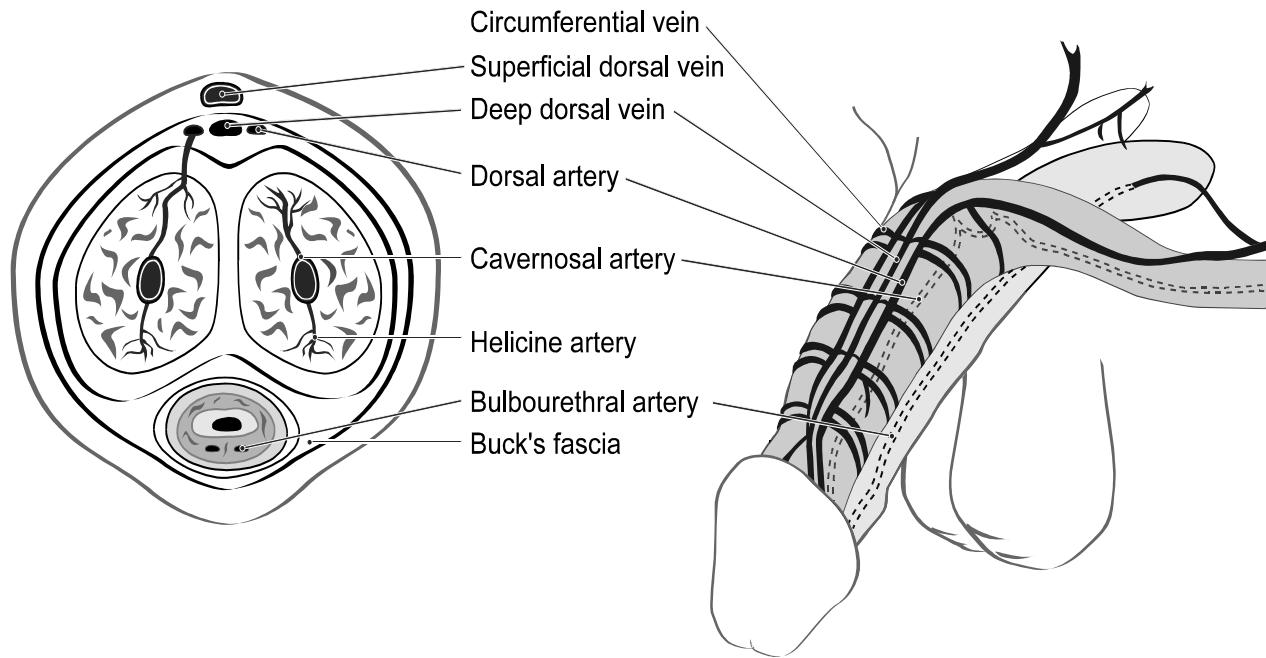

Penile anatomy

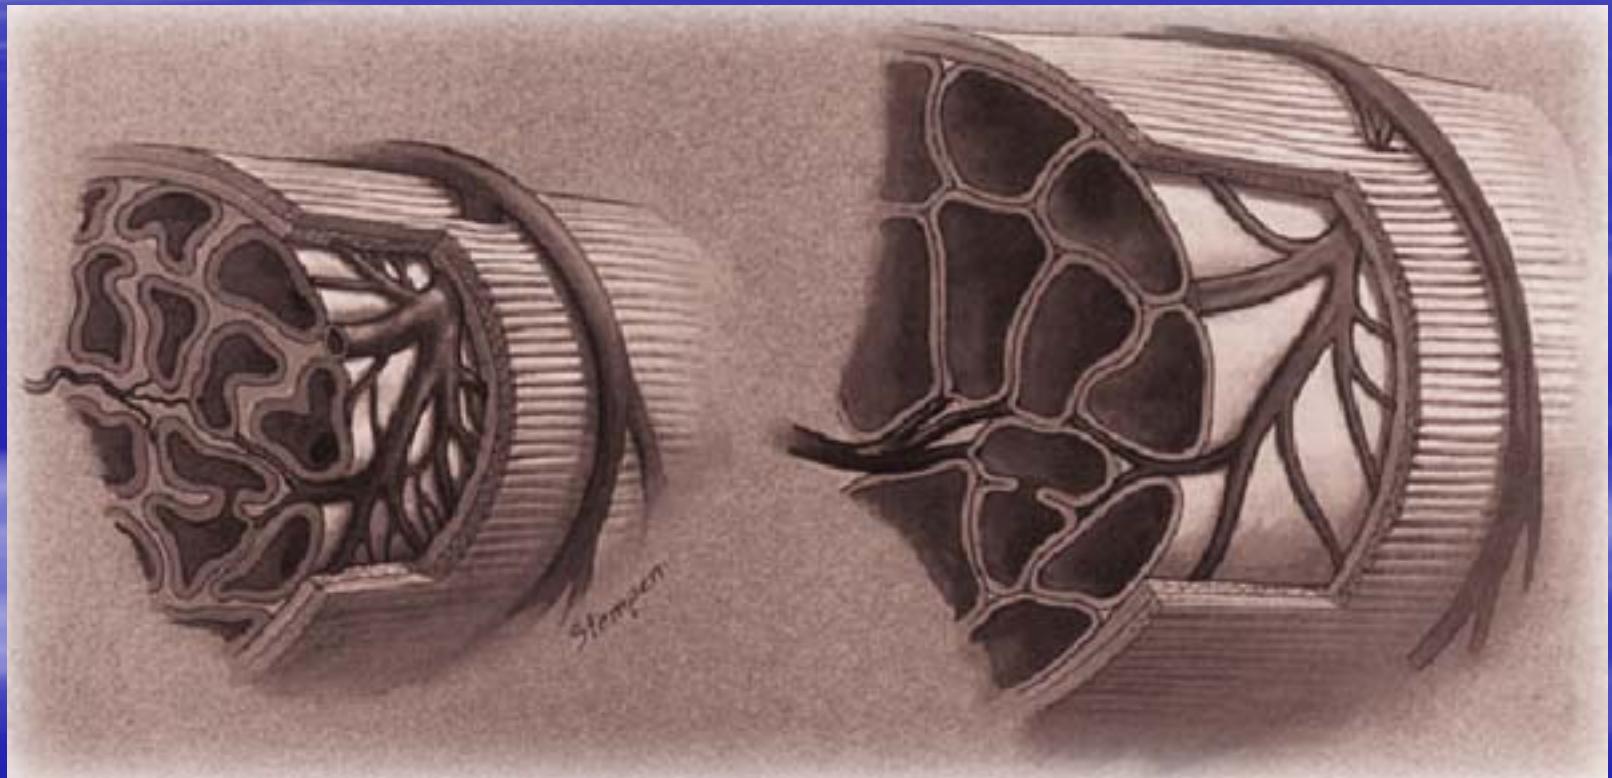

Vascularisation

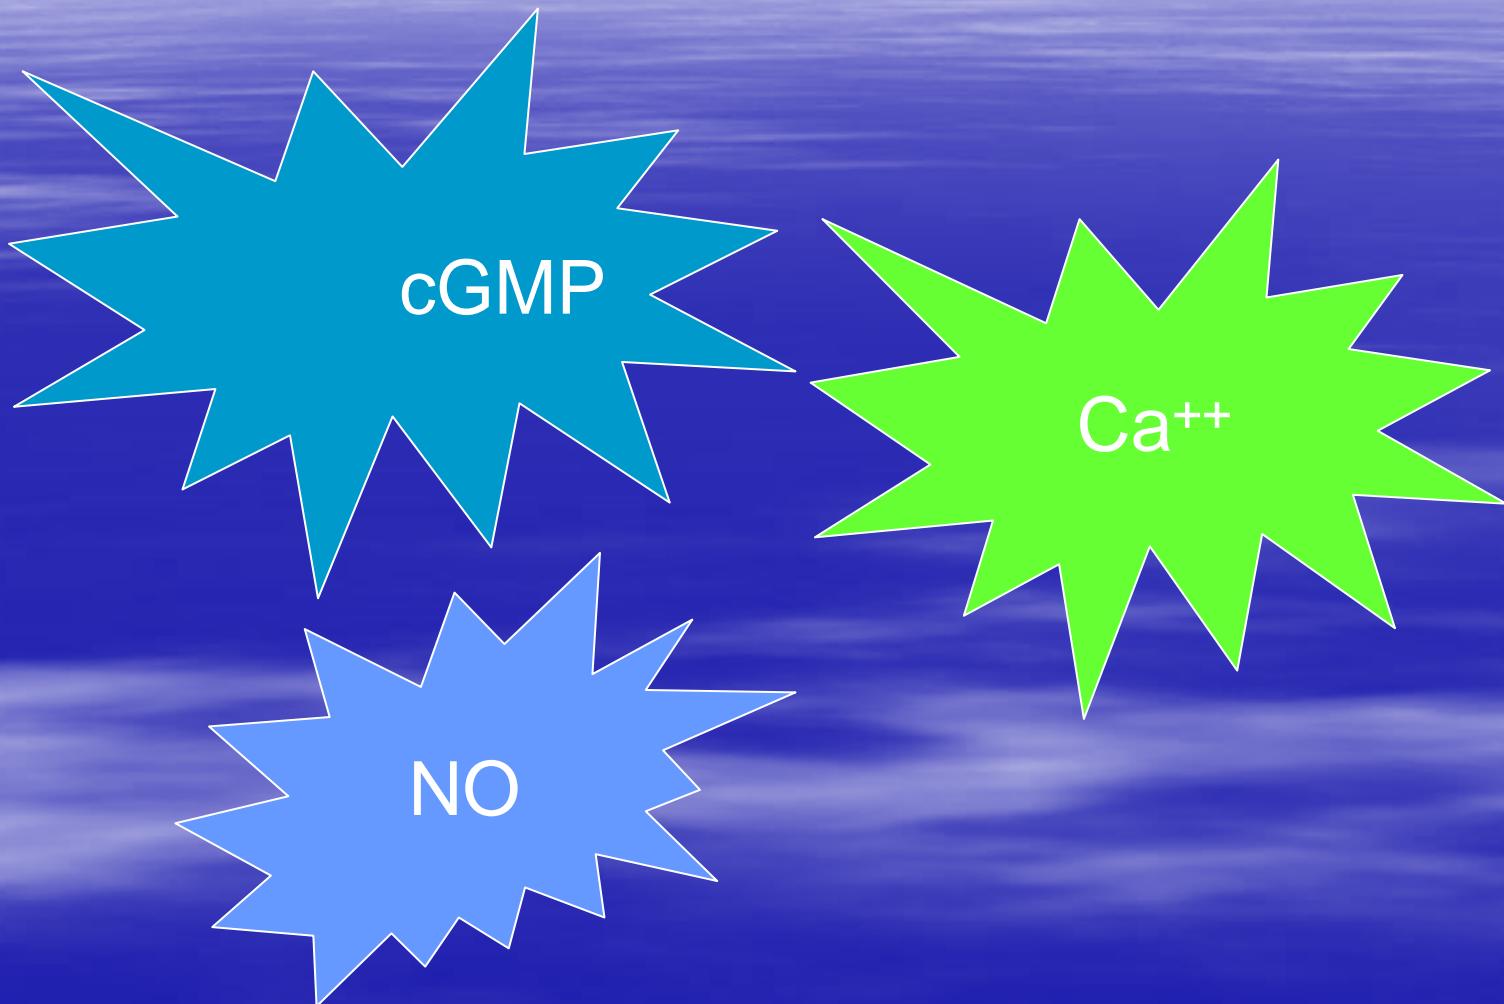

Anatomy of corpus cavernosus

Flaccidity

Erection

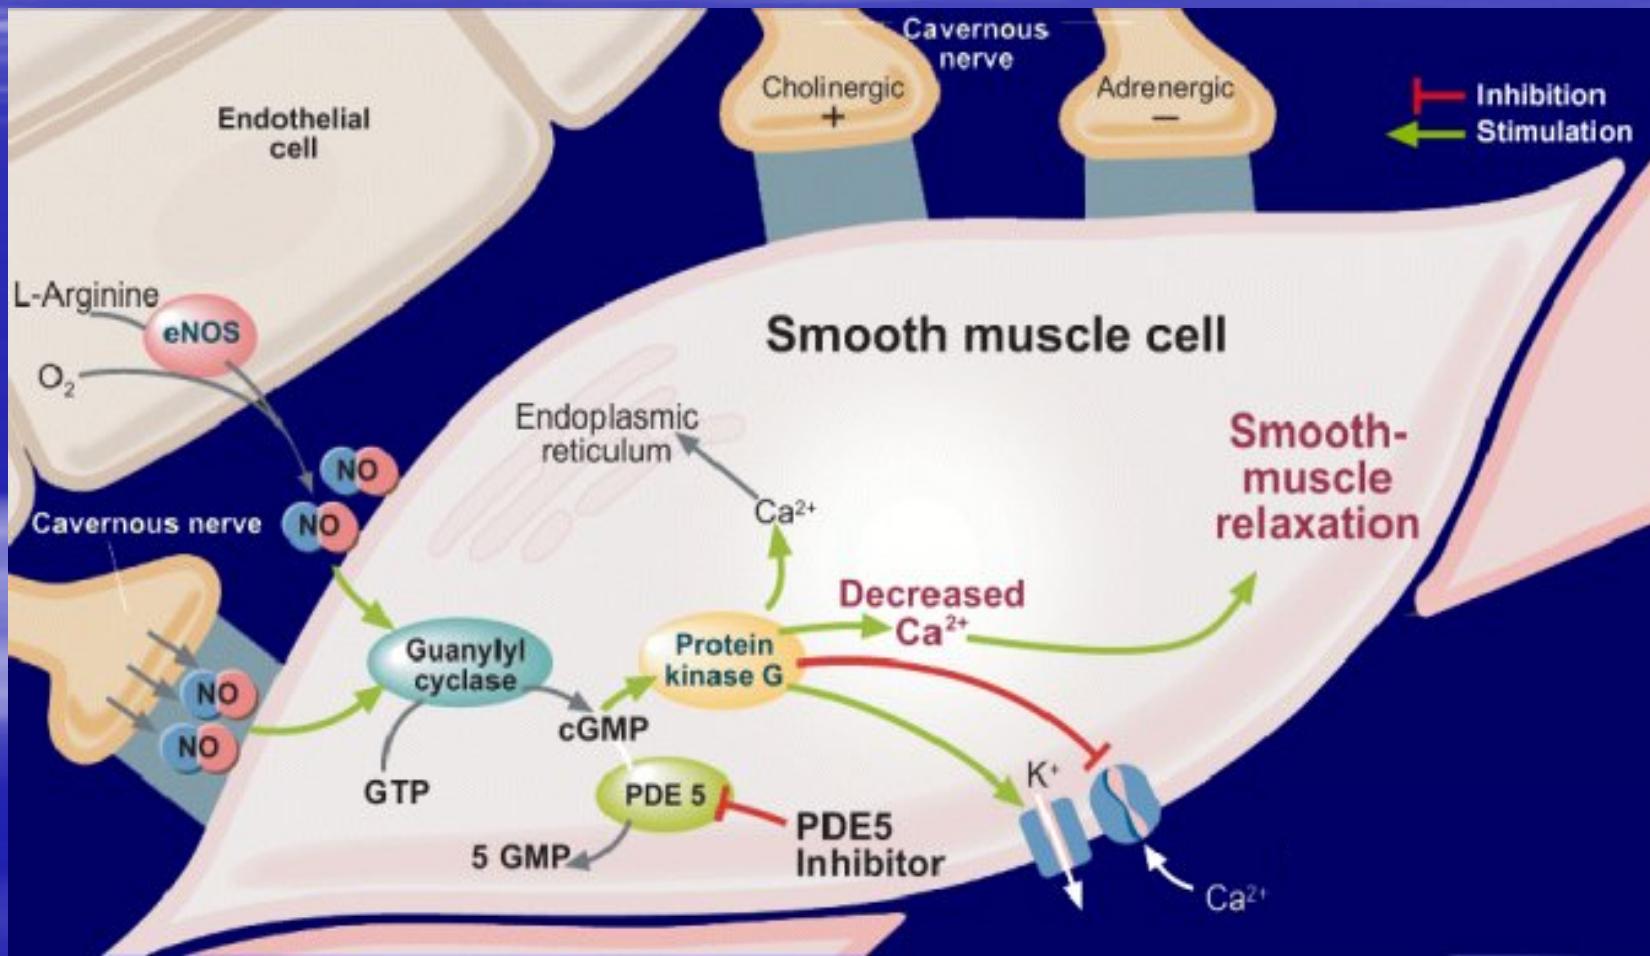

Erectile Physiology

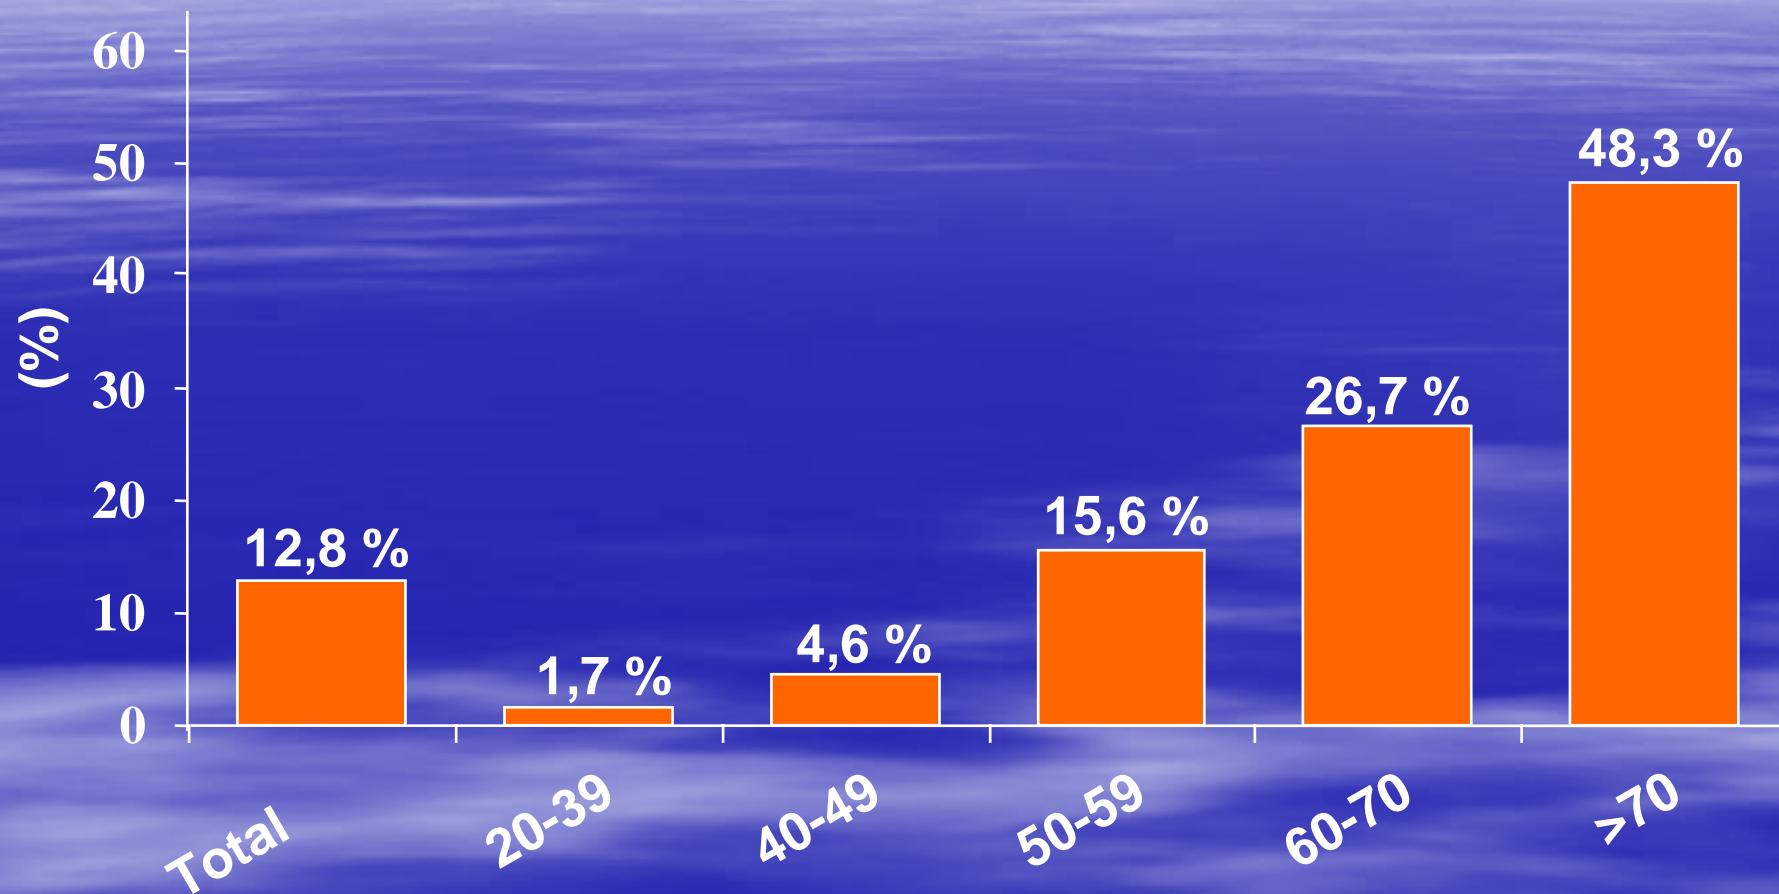

NO - cGMP

relaxation of the cavernous smooth muscle inducing erection

1. Anatomy and physiology of normal erection

3. Causes of erectile dysfunction
4. Diagnostic tools
5. Treatments

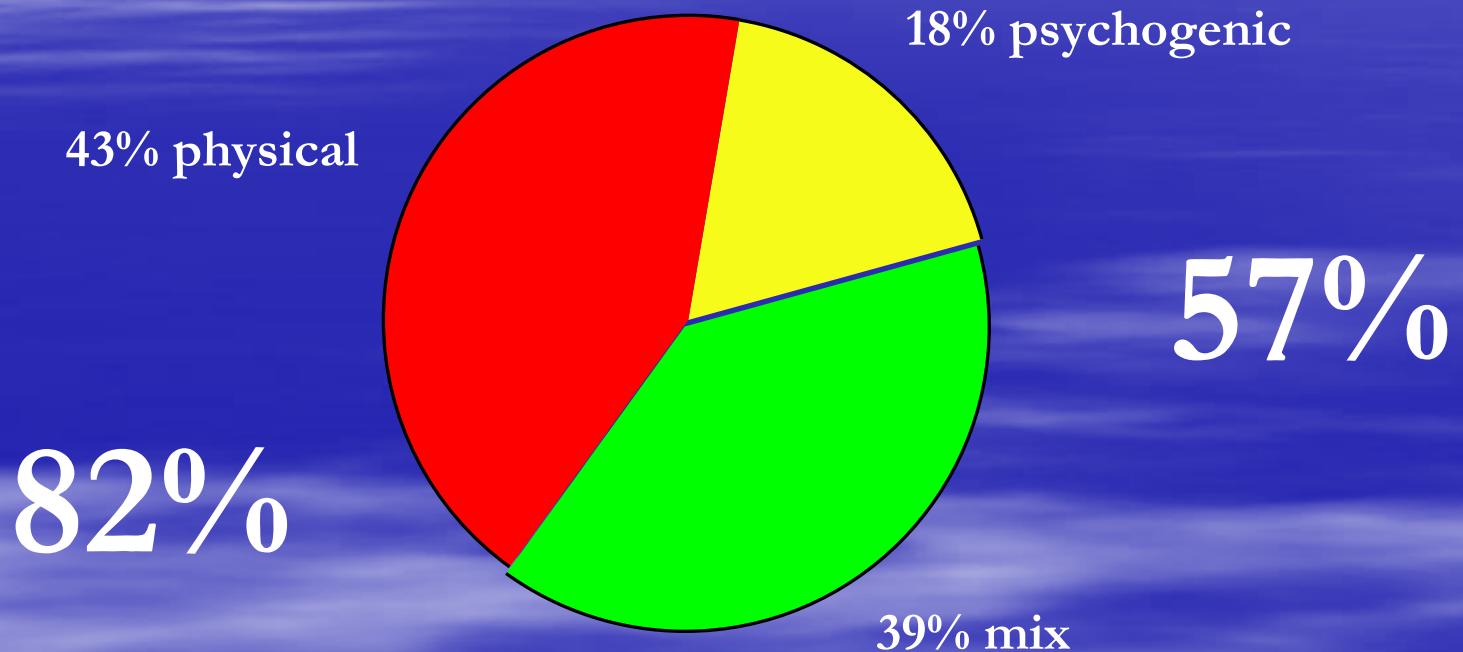

Incidence of erectile dysfunction in Europe

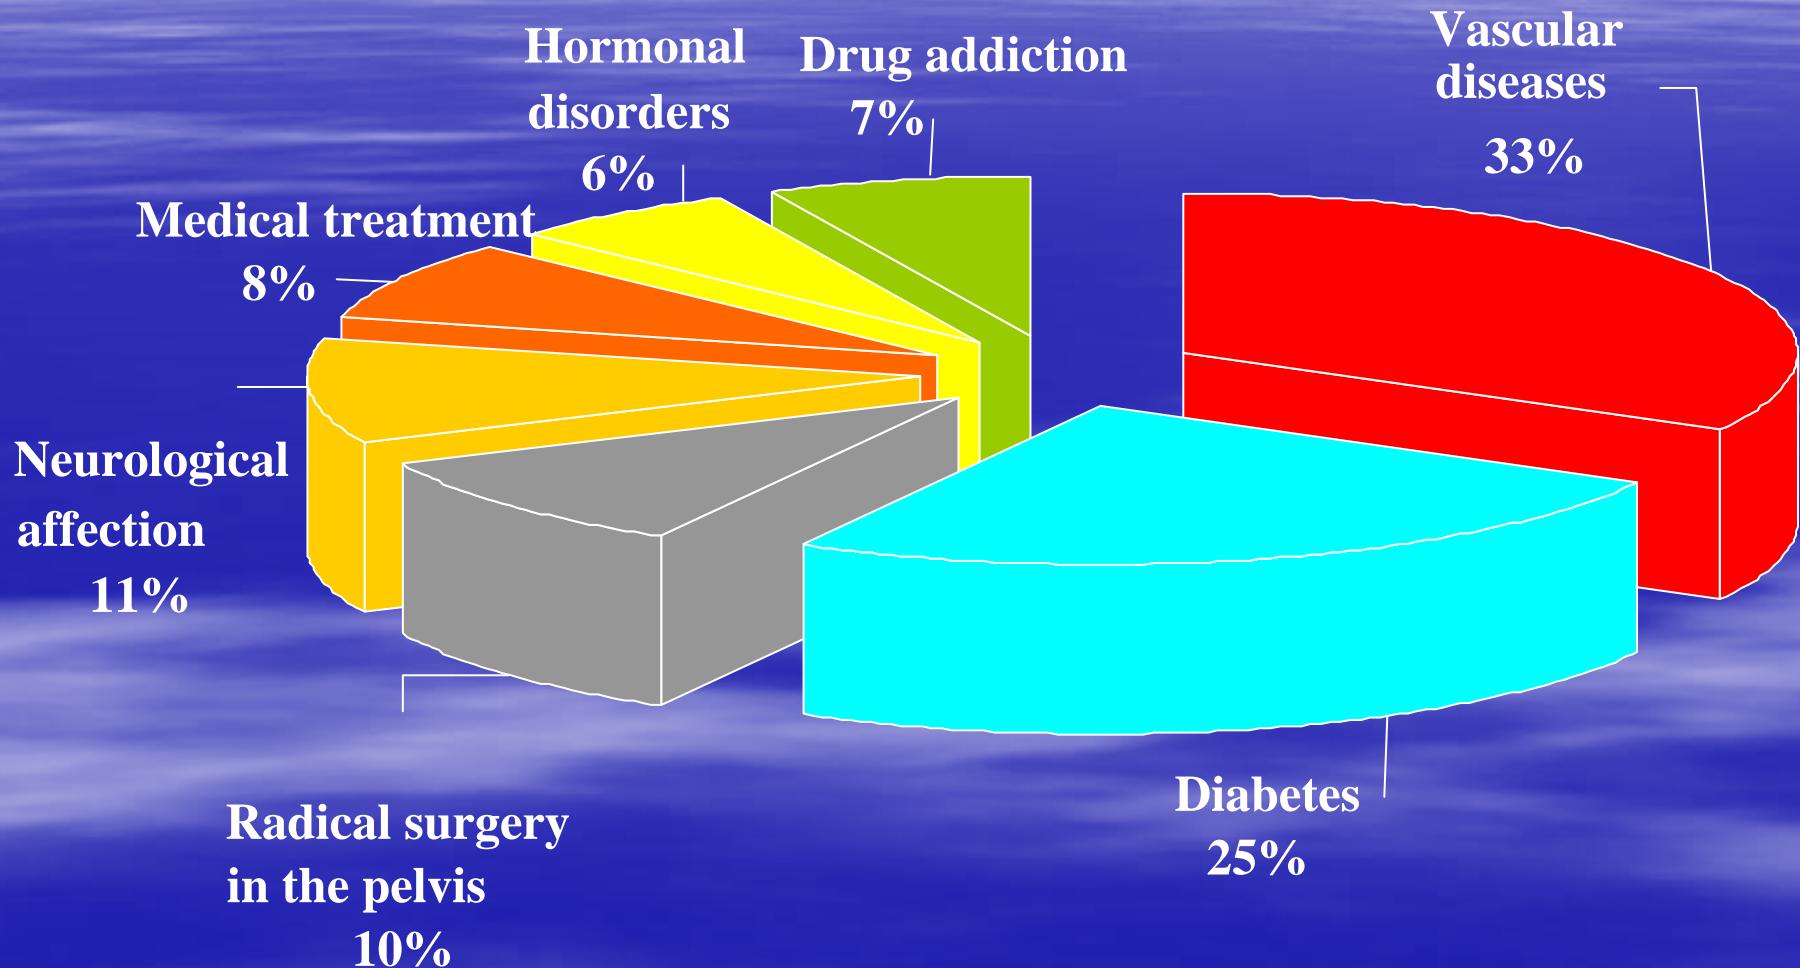

S.I.M.G. Epidemiologic Study, 1997

1. Anatomy and physiology of normal erection
2. Incidence of erectile dysfunctions
3. **Causes of erectile dysfunctions**
4. Diagnostic tools
5. Treatments

Causes of erectile dysfunctions

Causes of erectile dysfunctions

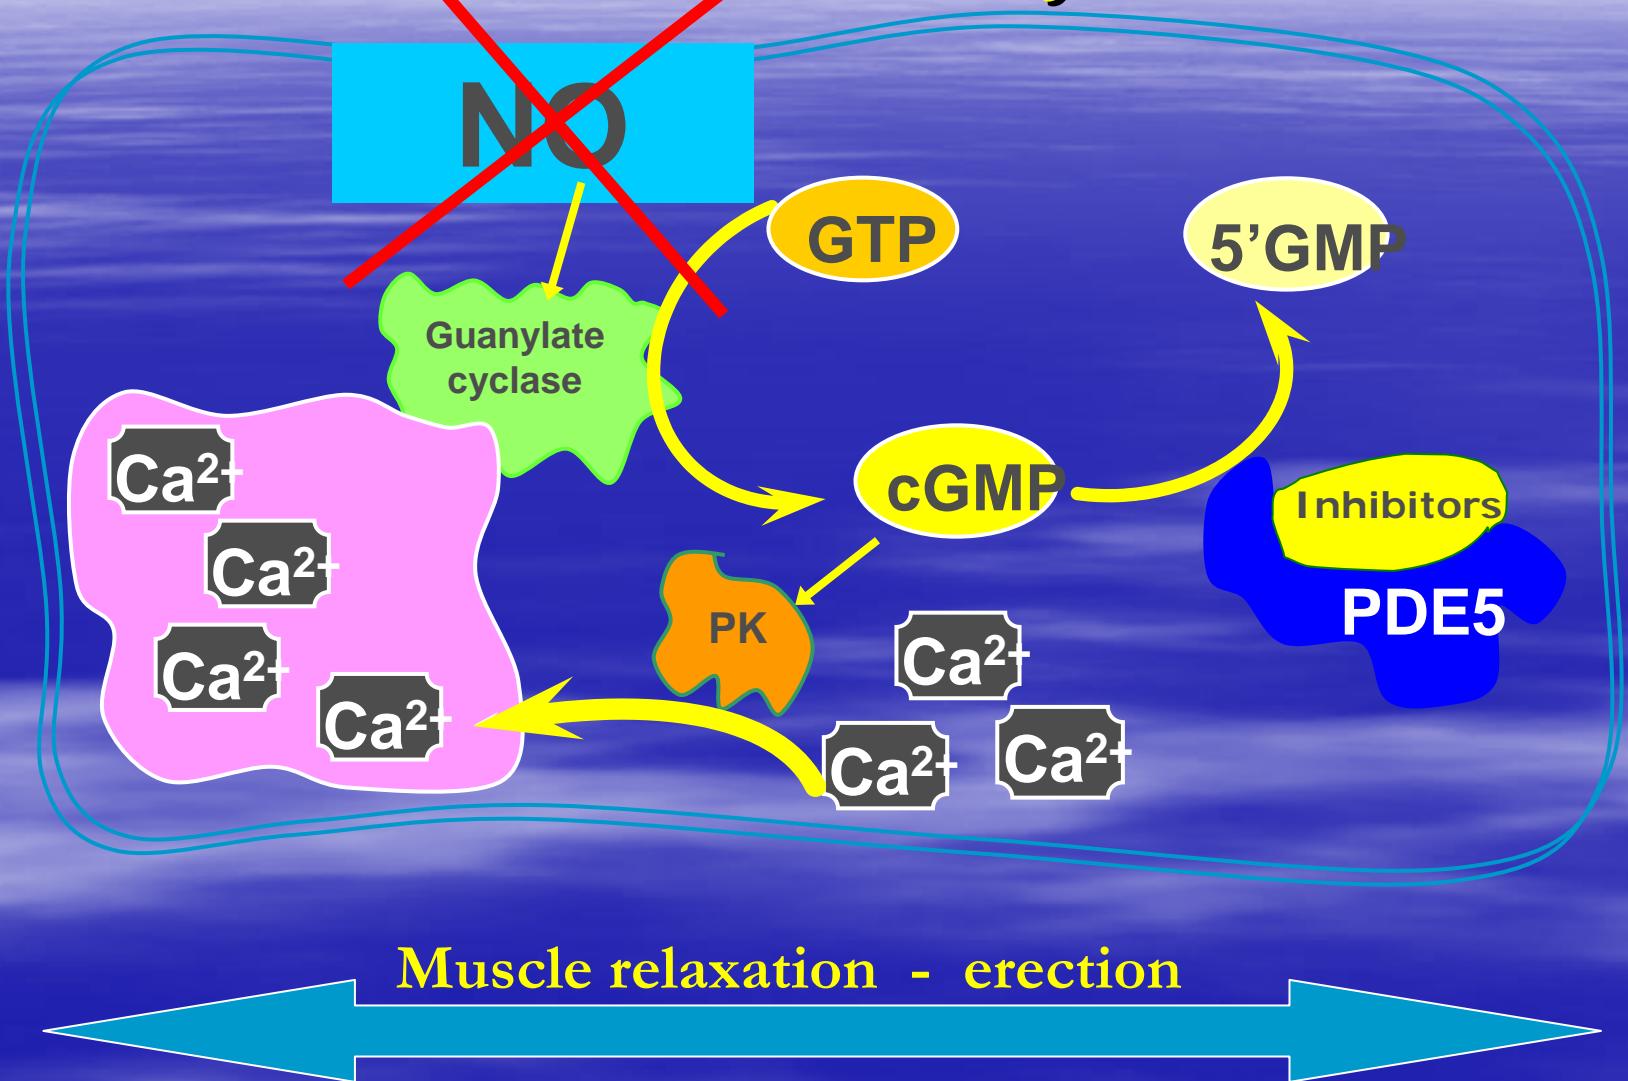

Causes of erectile dysfunctions

Role of the vascular endothelium

Any condition that induces a lack of NO production from the vascular endothelium may be a cause of erectile dysfunction.

Since NO secretion is centrally modulated (brain), any relational disturbance will negatively affect the corpus cavernous, The same way as a vascular or neurological disorder.

Causes of erectile dysfunctions

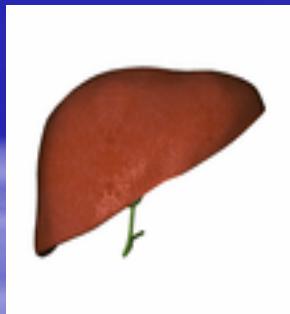

Hormones and aging

Pituitary

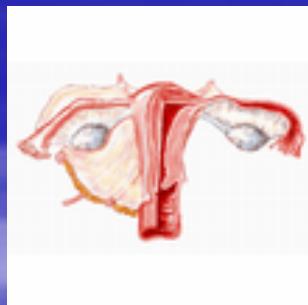

GH

IGF-1

Somatopause

LH / FSH

E₂ / T

Menopause / Androclysis

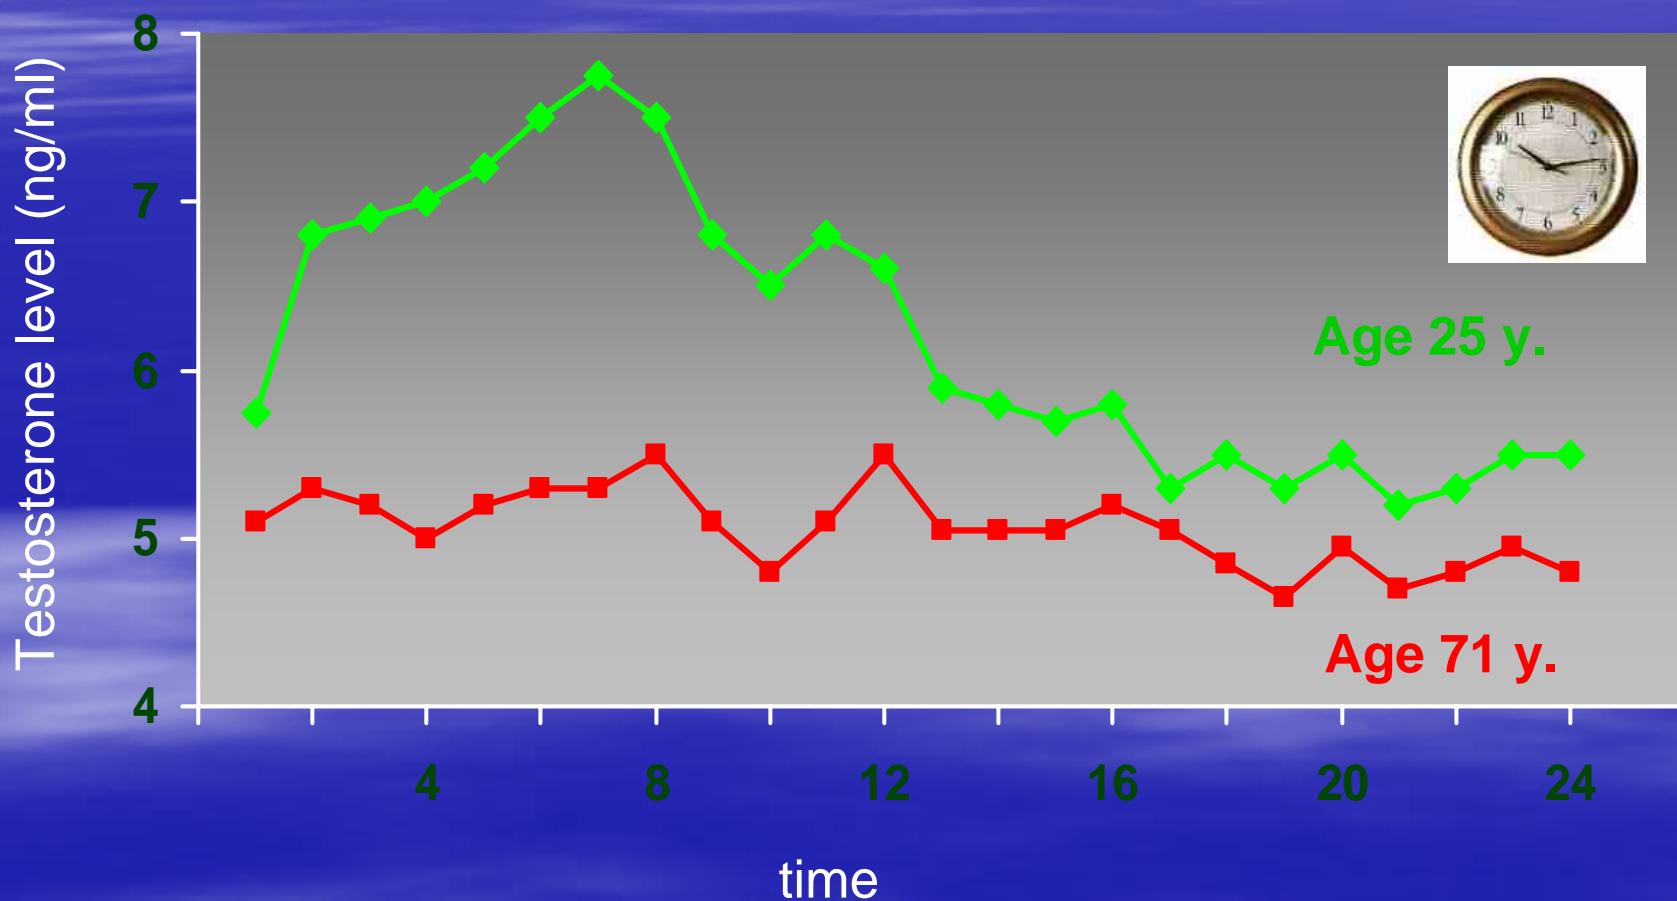

ACTH =

DHEA

Adrenopause

Day-night testosterone level

Bremner et al, J Clin Endocrinol Metab 1983; 56: 1278

1. Anatomy and physiology of normal erection
2. Incidence of erectile dysfunctions
3. Causes of erectile dysfunctions
4. **Diagnostic tools**
5. Treatments

Diagnostic tools

Special investigations

**Duplex sonography
with pharmacostimulation**

Intra cavernous injection test

Lab. Blood and hormonal status

Physical examination

History

History

- Onset, nature, duration
- Rigidity, shape of the penis
- External factors (psych. or prof. stress)
- Associated diseases
- Former therapies
- Expectations regarding the treatment.

Physical examination

- General condition
- Blood pressure, pulsations
- External genitals
- Inflammatory diseases (teeth)
- DRE
- Neurological evaluation

Lab tests

- Fasting glycaemia
(HbA1c)
- Lipidic profile
- Blood formula
- Liver enzymes
- Hormones
 - Testosterone (free)
 - (PRL – TSH – T4)
- PSA
 - % free PSA
- urine

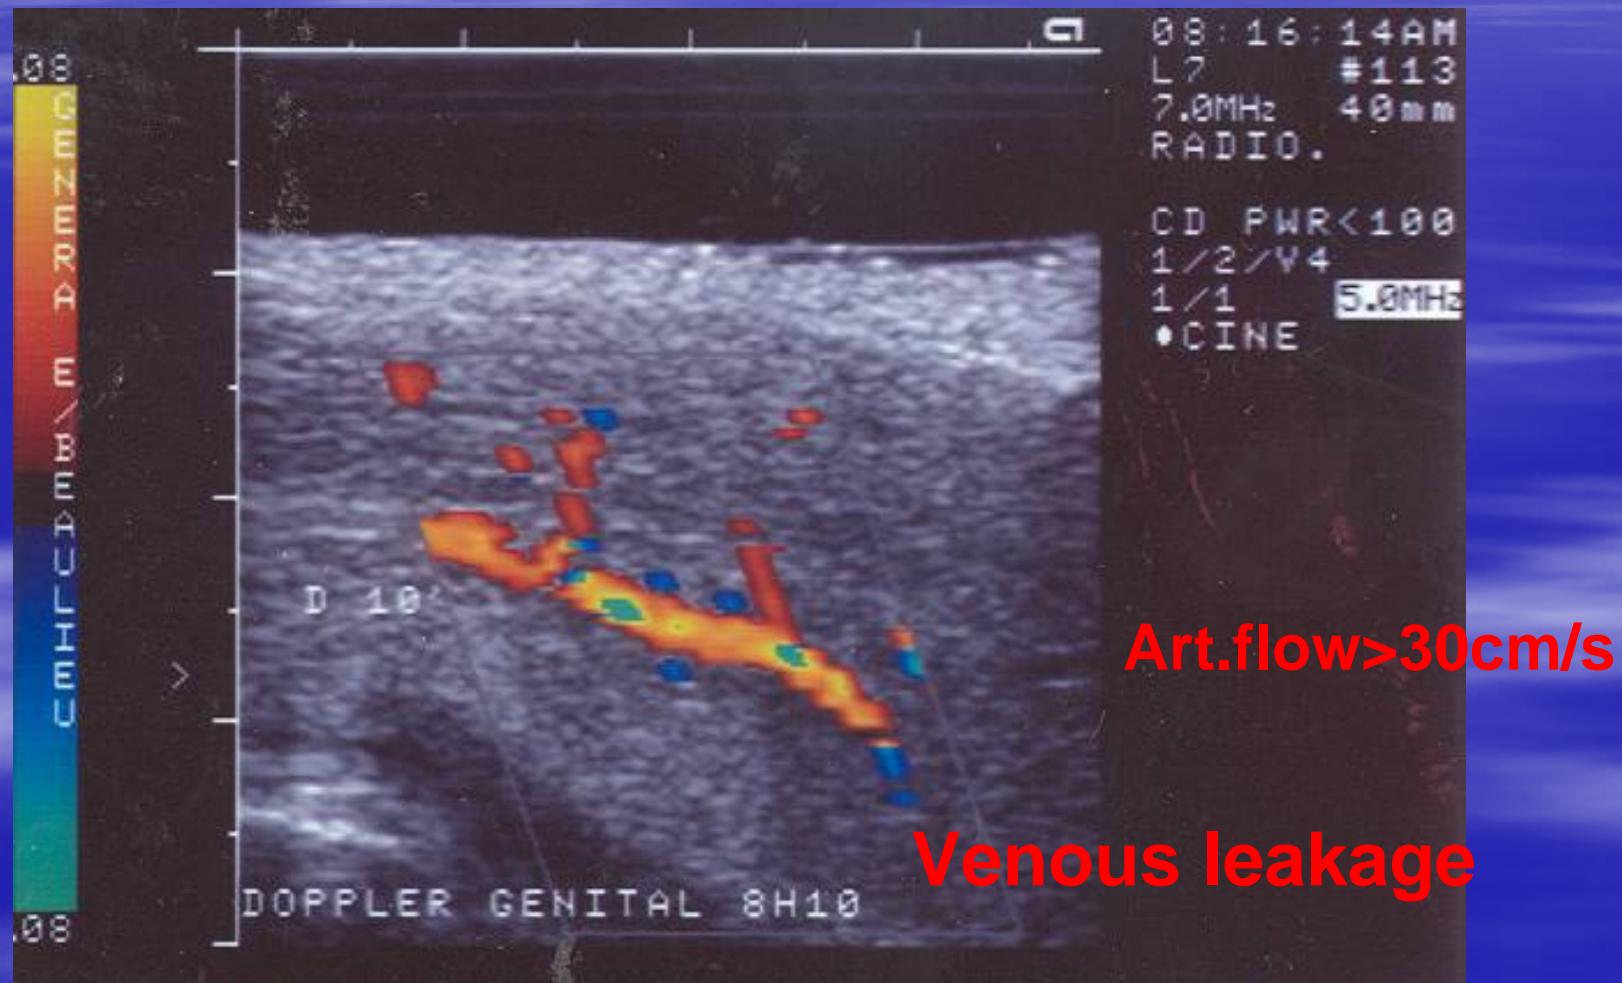

Specific tests

- Duplex sonography + intracavernosal prostaglandin

- Nocturnal Penile tumescence test
- Vascular imaging
- Neurological testing

Duplex sonography

PGE1 injection

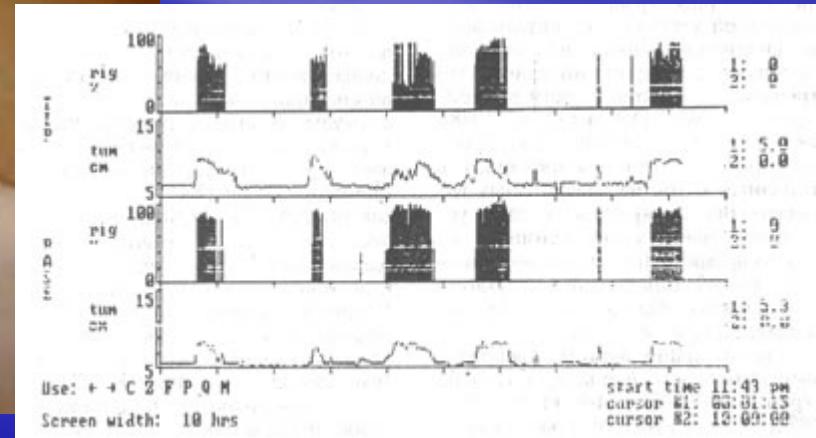

NPT

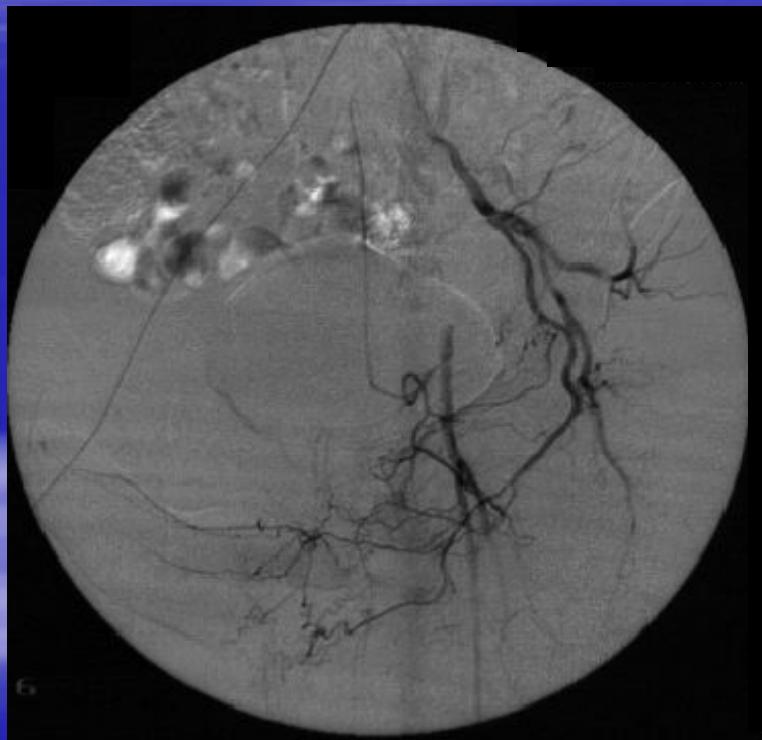

REM sleep phases

History

Vascular radiology

arteriography

cavernosography

Anxiety / fibrosis

1. Anatomy and physiology of normal erection
2. Incidence of erectile dysfunctions
3. Causes of erectile dysfunctions
4. Diagnostic tools
5. **Treatments**

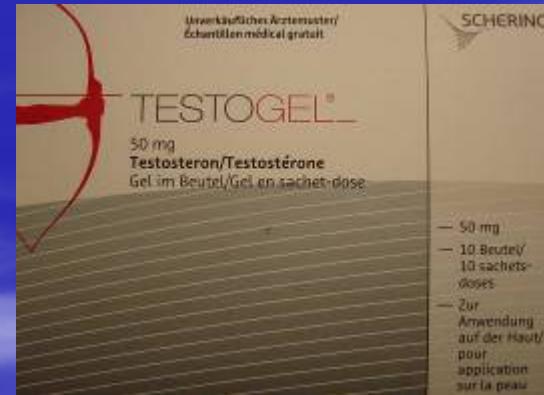

Hormonal treatment

- Testosterone injection
- Testosterone oral
- Testosterone transdermal

testosterone undecanoate

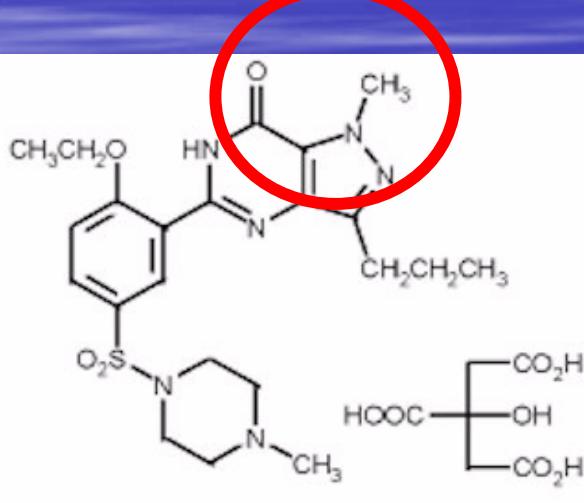

testosterone enanthate

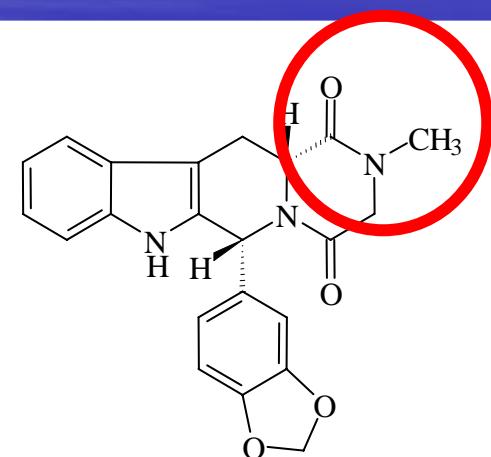

Testosterone gel

PDE5 inhibitors

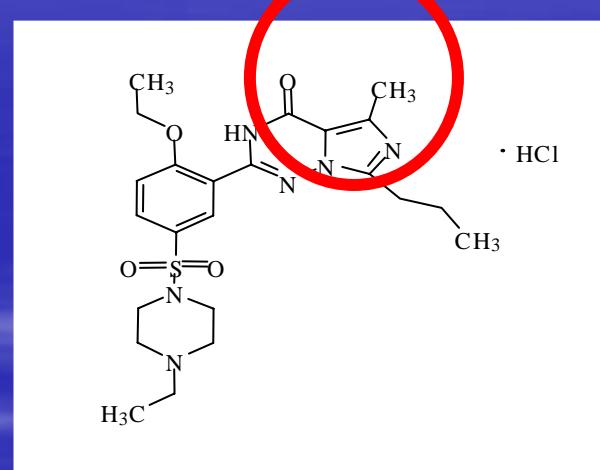

Sildenafil

Tadalafil

Vardenafil

Viagra®

Pfizer

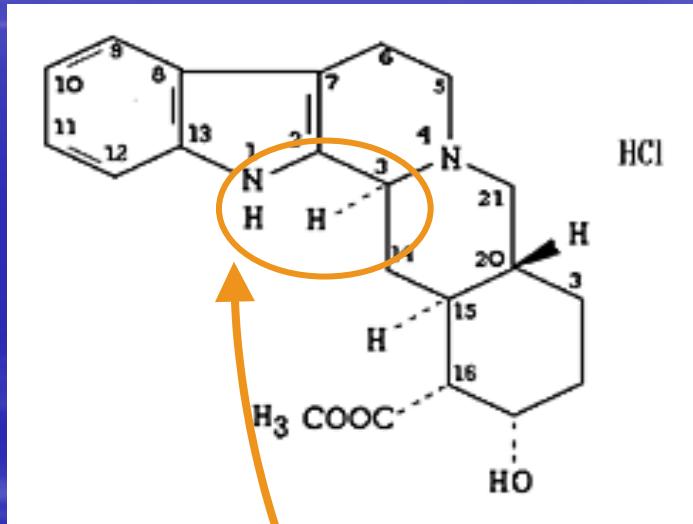

Cialis®

Lilly-Icos

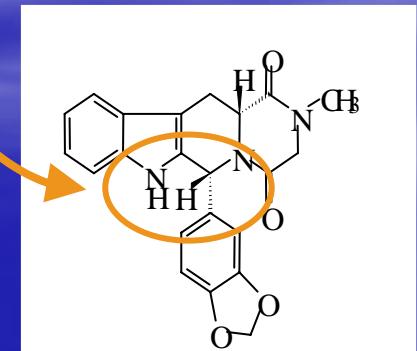

Levitra®

GSK-Bayer

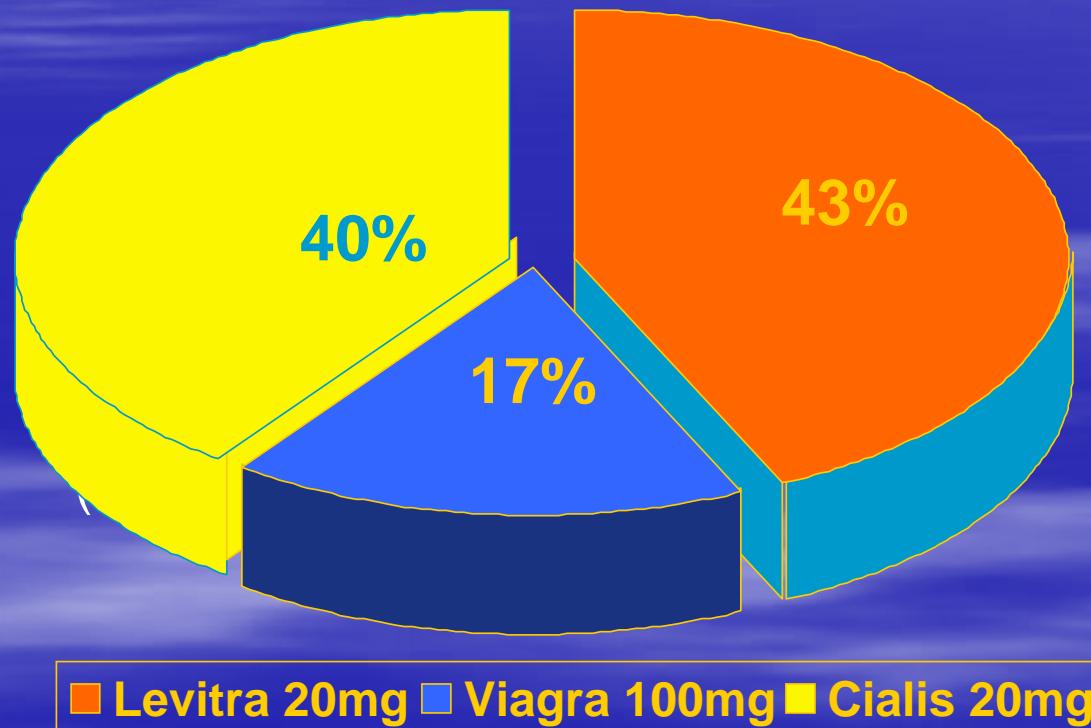

yohimbini

Tadalafil (Cialis)

PDE5 inhib. preferences

MACA

(*lepidium Meyenii*)

Gonzales G. & al. 2002. Effect of *Lepidium Meyenii* (MACA) on sexual desire and its absent relationship with serum testosterone levels in adult healthy men. *Andrology* 34, 367-372.

PDE5 inhibitors, what dosage?

- Occasional treatment
 - 1 tabl. 30 to 60 min before planned intercourse
- Long term treatment
 - Tadalafil (Cialis): 1-2 x 20 mg per week during 2-8 weeks
 - Vardenafil (Levitra): 2-3x 5 or 10 mg per week during 2-8 weeks
 - Sildenafil (Viagra): 2-3x 25 or 50 mg per week during 2-8 weeks

PDE5 inhibitors, tips

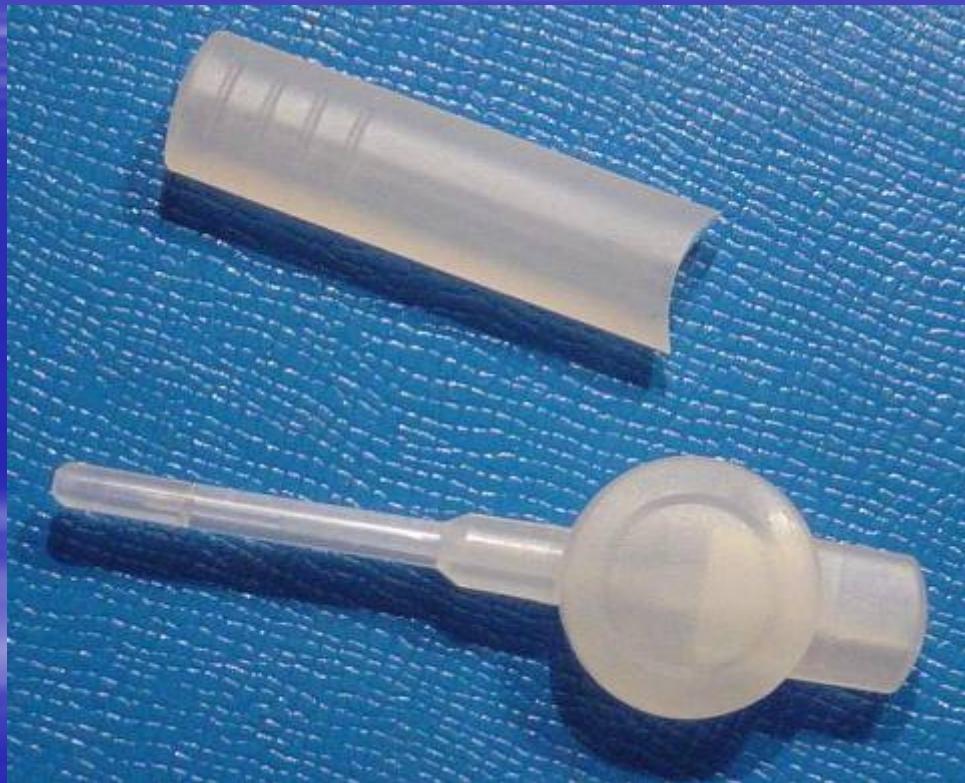

- It is important to separate the intake of the pill from the intercourse in order to avoid a medically generated performance anxiety.
- The medication shall not necessarily induce a rigid erection
- It should facilitate an erection following a normal love process.

PDE5 inhibitors: warning

- Simultaneous treatments with NO donors (nitro-glycerine etc) that will induce a possibly dangerous hypotension
- Contra indication to sexual activity
- Cardiovascular diseases like
 - Recent myocardial infarction or angina
 - Ictus
 - Arrhythmia, uncontrolled hypertension

Muse

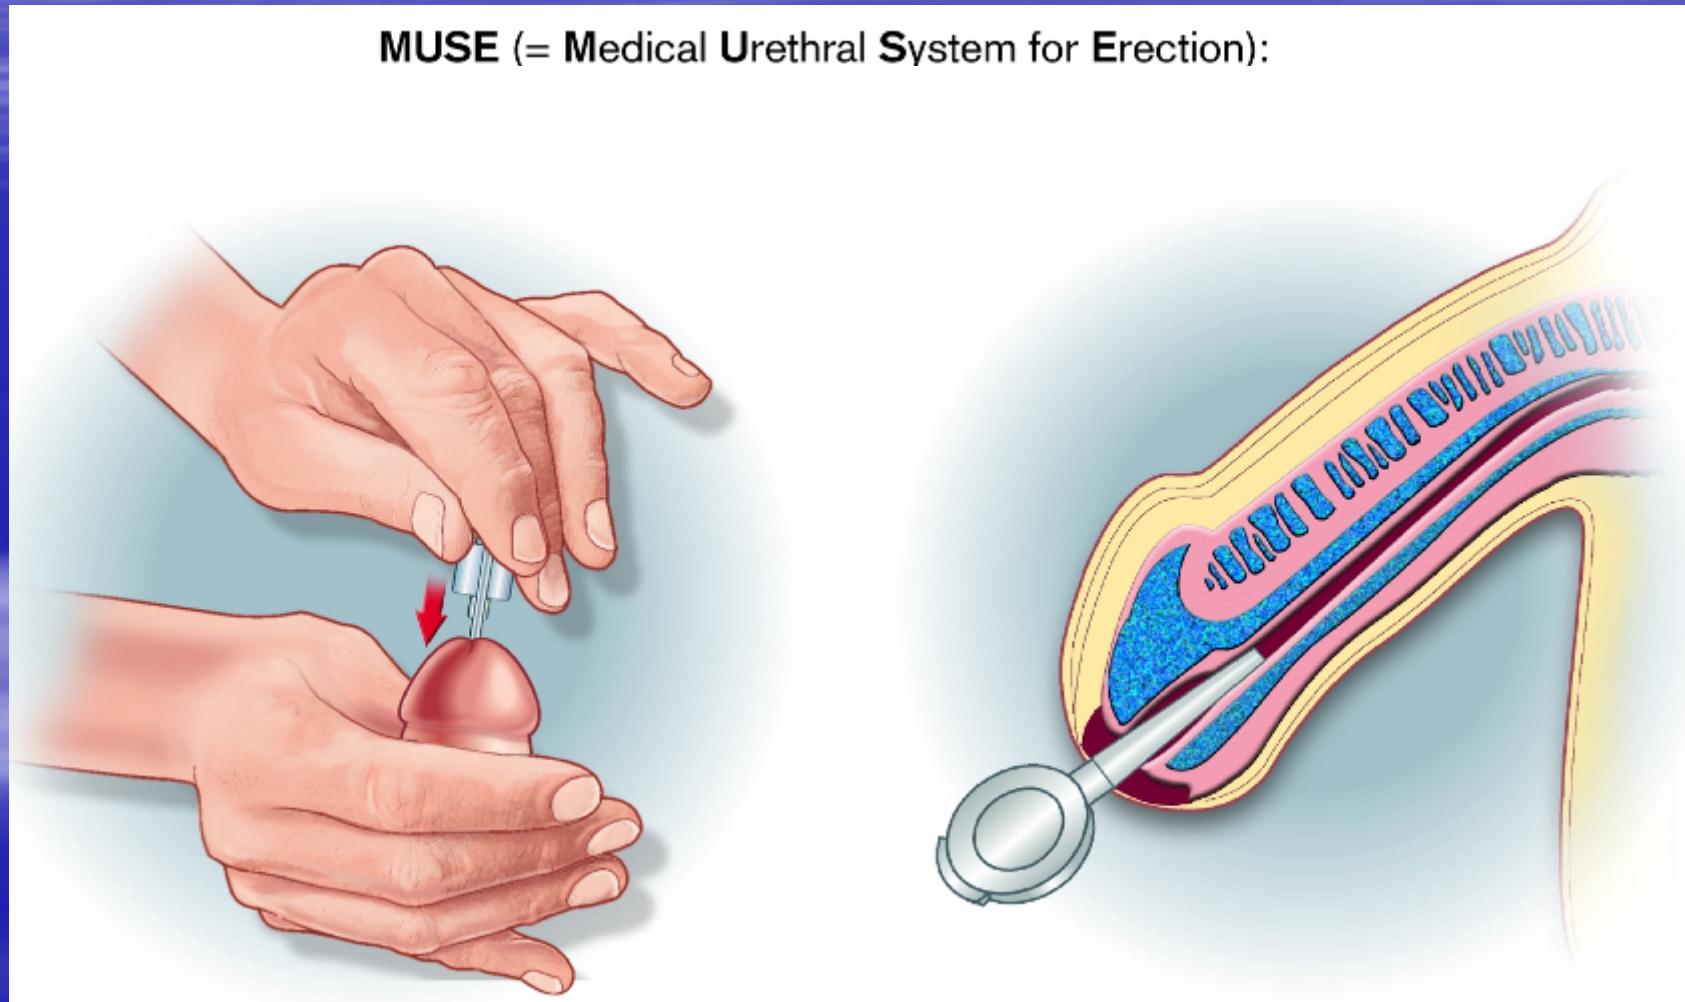

Alprostadil

MUSE

Alprostatal

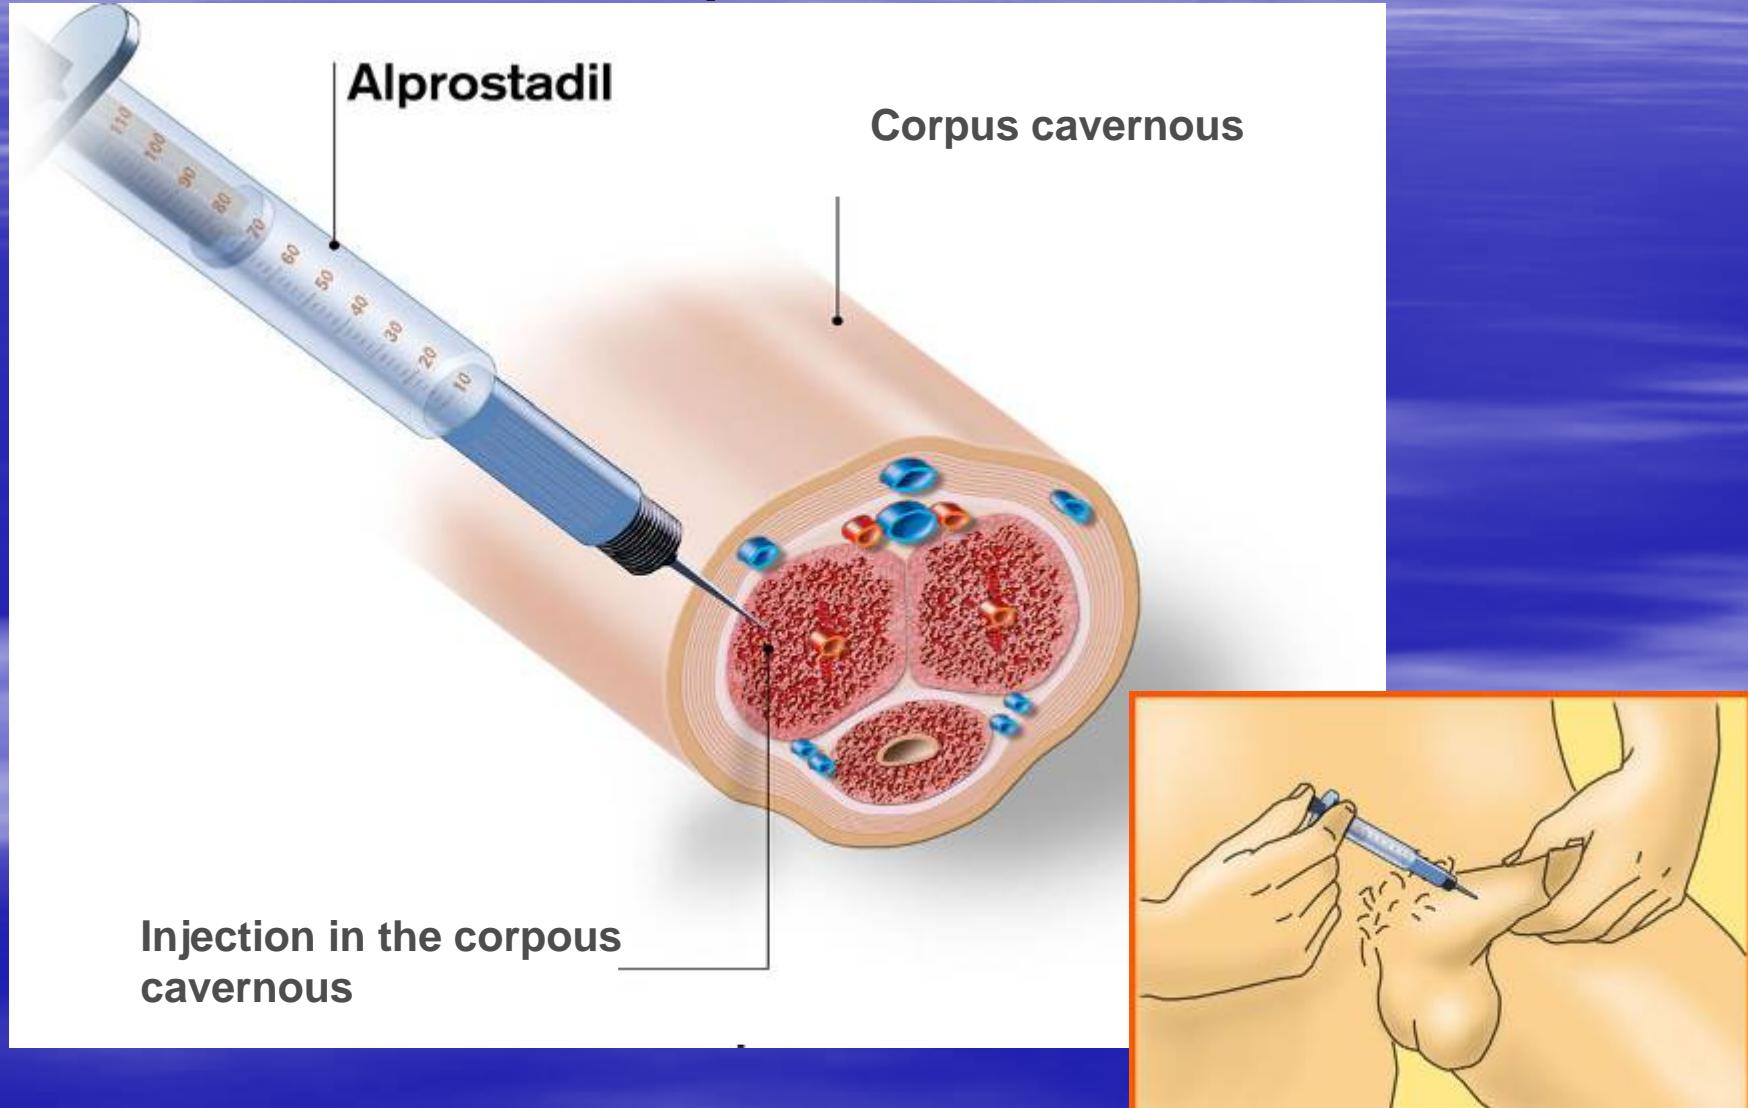

MUSE (= Medical Urethral System for Erection):

Caverject Alprostatil

Caverject Alprostatal

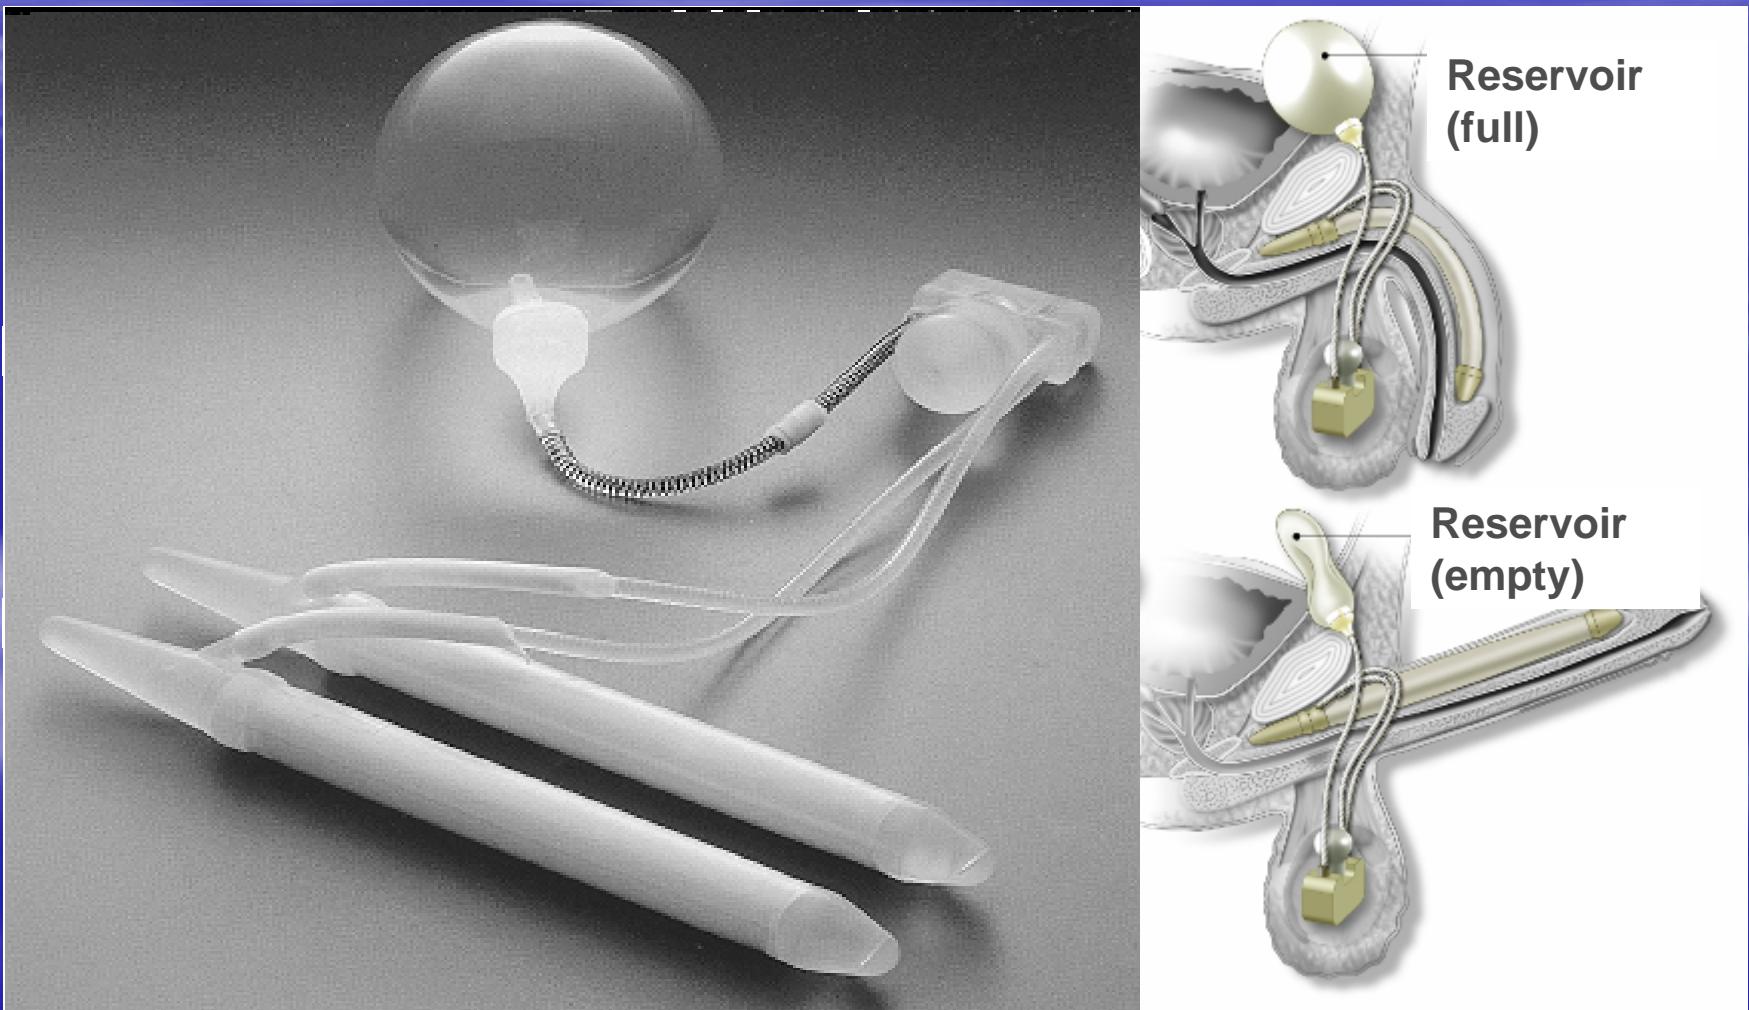

Semi rigid implant

Acuform (Mentor)

Inflatable implant (AMS 700)
