“Epidemiologist know a lot about the correct way to conduct a research study but less about how to review and synthesize data from multiple studies and this, I suggest, is a principal source of the public’s confusion when faced with a new result from an epidemiological study”

Bracken MB. IJE 2001:954
Systematic reviews of observational data

A Betran  WHO/RHR
What are observational studies?

- Data from existing database
- Cross-sectional study
- Case series
- Case-control study
- Cohort study
- Design with historical controls
Why do we need systematic reviews of observational studies?

- Aetiological hypothesis
- Evaluation of interventions designed to prevent rare outcomes
- Evaluation if outcomes of interest are far in the future
- Evaluation of effectiveness in a community

RCT
(Lack of precision)

Meta-analysis

More reliable estimates
Observational studies

(Confounding, bias)

Meta-analysis

More reliable estimates????
Helicobacter pylori

Coronary heart disease

1122 cases

Response rate: 60%

1122 controls

Response rate: 20%

The protective effect of beta-carotene that wasn’t

**Cohorts**
- Male health workers
- Social insurance, men
- Social insurance, women
- Male chemical workers
- Hyperlipidaemic men
- Nursing home residents

**Trials**
- Male smokers
- Skin cancer patients
- (Ex)-smokers, asbestos workers
- Male physicians
There are examples of observational studies producing similar results of those from RCT.

But observational studies will always have to deal with bias and confounding because the intervention was deliberately chosen and not randomly allocated.
Figure 1. Results of Observational Studies and Randomized Controlled Trials.
Concato et al.,
NEJM, 2000;342:1887-92

- Bacille Calmette–Guérin vaccine and tuberculosis
- Mammography and mortality from breast cancer
- Cholesterol levels and death due to trauma
- Treatment of hypertension and stroke
- Treatment of hypertension and coronary heart disease

Relative Risk or Odds Ratio
This does not mean to return to narrative reviews
Benefits of MAOS:

- Systematic and explicit rules
- Statistical power
- Insight into variable interpretation
- Detection of discrepancies
- Deepness into heterogeneity
- Identification of gaps in knowledge
Reporting of background should include:

1. Problem definition, hypothesis statement
2. Description of study outcome(s)
3. Type of exposure or intervention used
4. Type of study designs used
5. Study population
Reporting of search should include:

6. Qualifications of searchers
7. Search strategy including time period
8. Effort to include all available studies
9. Databases and registries searched
10. Searching software used
11. Use of hand searching
12. List of citations located and those excluded, including justification
13. Methods of addressing articles not published in English
14. Methods of handling abstracts and unpublished studies
15. Descriptions of any contact with authors
Reporting of methods should include:

16 Description of relevance/appropriateness of papers assembled for assessing the hypothesis to be tested

17 Rational for the selection and coding of data

18 Documentation about how data were classified and coded

19 Assessment of confounding

20 Assessment of study quality, including blinding of quality assessors; stratification or regression on possible predictors of study results

21 Assessment of heterogeneity

22 Description of statistical methods in sufficient detail to be replicated

23 Provision of appropriate tables and graphics
Reporting of results should include:

24 Graphic summarizing individual study estimates and overall estimate

25 Table giving descriptive information for each study included

26 Results of sensitivity testing (e.g. subgroup analysis)

27 Indication of statistical uncertainty of findings
Reporting of discussion should include:

28 Quantitative assessment of bias

29 Justification for exclusion

30 Assessment of quality of included studies
Reporting of conclusions should include:

31 Consideration of alternative explanations for observed results

32 Generalization of the conclusions

33 Guidelines for future research

34 Disclosure of funding source
Quality of reviews in Epidemiology
Breslow R. AJPH, 1998;88:475-7

All 1995 issues of 7 widely read epidemiology journals were searched for reviews

29 reviews were found
## Reviews following quality guidelines

Other citations:

Summary

- SR and MA of observational studies are as common as reviews of RCT.
- Confounding and selection bias often distort the findings.
- Danger in producing very precise but spurious results.
- More is gained by examining heterogeneity.
WHO Systematic review of incidence/prevalence of maternal mortality and morbidity 1997-2002
Objectives

• To provide a comprehensive, standardised and reliable tabulation of available data on maternal morbidity
• To provide up-to-date data for future maternal mortality estimates
• To provide case-fatality rates
Objectives (cont.)

• To estimate relative risks for maternal mortality in different health care scenarios

• To calculate the proportion of maternal deaths that can be averted (preventable fraction) by eliminating or reducing leading morbidities
WHO systematic review

5. Data source
(1) Vital statistics/census
(2) Medical record
(3) Special survey/interview
(4) Multiple sources
(5) Clinical data collected for the study
(6) Other, specify __________________________

6. Lowest unit of data source
(1) Cluster
   6a. Number of clusters
(2) Individual
(3) Other, specify __________________________
9. Population studied
   (1) Urban
   (2) Rural
   (3) Mixed
   (4) Unknown

10. Description of the characteristics of the population studied (e.g. socio-economic status, ethnic group, age group, etc.)
