Geneva 2005

IAMANEH Scholarship

# BACKGROUND

- Newborns feel pain
- Pain caused brain damage → hypoxia, tachycardia, increased ICP
- Pain experienced → long term effect
- Effective treatment of pain is needed
- Analgesic effect of glucose → beta endorphin

# OBJECTIVES

- To assess analgesic effect of glucose during venepuncture
- Hypothesis:
  - \*Oral glucose more effective than placebo
  - \*Oral glucose < 2ml less effective
  - \*Effect increased if combined with other technique

# CRITERIA FOR CONSIDERING STUDIES FOR THIS REVIEW

## TYPES OF STUDIES

- All RCT, crossover studies comparing outcome oral glucose vs other interventions
- ◆ Contamination & co-intervention → excluded

## TYPES OF PARTICIPANTS

- Healthy infants: preterm & term, 1-30 days, APGAR score at least 7 at 5 min.

## TYPES OF INTERVENTION

- ◆ Oral glucose before venepuncture vs no treatment, placebo, sucrose, fructose, sucking, multisensorial stimulation

## TYPE OF OUTCOME MEASURED

- ◆ Evaluation of pain

## SEARCH STRATEGY FOR IDENTIFICATION OF THE STUDIES

- Medline search

- Cochrane controlled trial registry search

# METHODS OF REVIEWS IN PREPARATION

- Abstract and title were screened
- Inclusion criteria applied
- Methods of randomization → summarized
- Quality of study → specified criteria for elimination bias (selection bias, performance bias, attrition bias and detection bias) → scored
- Pain score: DAN score & PIPP score

# Douleur Aiguë Nouveau-né (DAN) pain score

- 1) Eyes closed, regular breathing, no movements
- 2) Eyes closed, irregular breathing, no movements
- 3) Eyes open, no gross movements
- 4) Eyes open, continual gross movements, no crying
- 5) Eyes open or closed, fussing, or crying

Pain score from 1 to 10, where 1 is no pain and 10 is maximum pain

# Premature Infant Pain Profile (PIPP) pain score

Has been designed to assess pain in preterm and term infants

- ◆ Calculated from 7 different items, each graded from 0 to 3
- ◆ 2 items: neonatal characteristics (gestational age and behavioral state before the painful event)
- ◆ 2 items: physiologic measurements (heart rate and oxygen saturation)
- ◆ 3 items: facial movements (brow bulge, eye squeeze and naso-labial furrow)
- ◆ 5 items: change from baseline during a successive observation period of 30 second

A total PIPP score of 6 or less generally indicates minimal or no pain

# STUDIES DESCRIPTION

- 7 RCT: 5 true rct, 2 crossover studies
- All in developed countries: Italy, Germany, Sweden, France
- Sample size: 386, participants: 402 infants
- 2 Studies excluded
- 4 Std → term infant; 1 std → preterm
- 5 Std → DAN score, 2std → PIPP score
- Characteristics of the studies in table 1

**Table 1.Characteristics of include studies**

<b>STUDIES</b>	<b>METHODS</b>	<b>PARTICIPANTS</b>	<b>INTERVENTION</b>	<b>OUTCOME</b>
Valerio Belliani, 2002	RCT, blind; allocation concealment :B selection bias :B, Performance bias :A Attrition bias :A Detection bias :A	120 infants 30-40 weeks	Each group 20 infants: 1) Control no analgesic 2)1ml glucose 30% 3)1mlsterilwater&sucking 4)1ml glucose & sucking 5)Sensorial saturation &glucose 1ml glucose 30% 6)Sensorial saturation	Pain score (DAN score) Duration of crying
Karl Bauer, 2004	RCT, double blind Allocation concealment: A Selection bias :A Performance: A Attrition :A Detection: A	58 infants, ≥30 weeks >12h-8days	1)2ml oral glucose 30% (n=18) 2)0.4mlglucose 30%(n=20) 3)2ml sterile water(n=20)	Pain score (PIPP score) Duration of crying
R. Carbajal, 1999	RCT, prospective Allocation concealment: A Selection :A Performance: B Attrition :A Detection: A(	150 infants full term ≥ 24 hours	Each group :25 infants 1) No treatment 2) Placebo 2ml sterile water 3) 2ml 30% glucose 4) 2ml 30% sucrose 5) Pacifier 6) 2ml30% glucose &pacifier	Pain score (DAN score)
Mustapa Akcam, 2004	RCT, placebo control, crossover study Allocation of concealment; A Selection bias A Performance :A Attrition: A	34 healthy infants, 37-42 weeks >48hours to <28days,	Each infant was assessed three time 1)0.5ml of 30% fructose 2)0.5ml of 30% glucose 3)0.5ml of sterile water	Pain score (DAN score)
Ricardo Carbajal, 2002	RCT, prospective, two crossover study. Allocation of concealment: A Selection bias : A Performance :B Attrition :A	40 stable infants, ≤32 weeks, ≥48 hours.	1) 25 infants:0.3ml 30% oral glucose Vs 0.3ml sterile water 2) 15 infants:0.3ml 30% oral glucose Vs 0.3ml glucose+ sucking or pacifier	Pain score (DAN score)

**Table 2.Characteristic of exclude studies**

<b>STUDY</b>	<b>Reason for exclusion</b>
<b>Ricardo Carjabal, 2003</b>	Co-intervention effect of glucose by sucking pacifier It was not possible to extract data relating only to the effect of glucose because it co-intervention with effect of pacifier.
<b>Maria Gradin ,2002</b>	Contamination effect of glucose by addition placebo (sterile water) The effect of placebo also was studied comparing to effect glucose . It was not possible to extract data of pure glucose and pure placebo.

# METHODOLOGICAL QUALITY

- 7 Std met inclusion criteria
- Methods of randomization
  - \*6 used random number table
  - \*1 no mention of sample size calculation
  - \*1 used pharmacy performed randomization
  - \*1 no description of concealment allocation
- 5 Std used placebo controls

- Performance bias: 4 std → high score  
3 std → medium score
- Attrition bias: all std → high score
- Detection bias: 2 std (contamination and co-intervention) → excluded

# RESULTS

Studies	Participants N(n1&n2)	Outcome	Statistic methods	Result	Effect size
<b>1) 1ml glucose 30% VS no treatment</b>					
Belliemi CV, 2002	120(20&20)	Pain score/ DAN score	Median	9.5(1-10) Vs 9(5-10)	median dif: 0.5
<b>2) 1ml glucose 30% Vs 1ml sterile water and sucking</b>					
Belliemi CV, 2002	120(20&20)	Pain score/ DAN score	Median	9.5(1-10) Vs 6.3(4-10)	Median dif.3.2 P=0.001
<b>3) 1ml glucose 30% Vs 1ml glucose and sucking</b>					
Belliemi CV, 2002	120(20&20)	Pain score/ DAN score	Median	9.5(1-10) Vs 4(1-10)	Median dif.5.5 p<0.0001
<b>4)1ml glucose 30% Vs multisensorial stimulation</b>					
Belliemi CV, 2002	120(20&20)	Pain score/ DAN score	Median	9.5(1-10) Vs 8.5(1-10)	Median dif.1 P>0.5
<b>5)1ml glucose 30% Vs multisensorial stimulation and 1ml glucose 30%</b>					
Belliemi CV, 2002	120(20&20)	Pain score/ Dan score	Median	9.5(1-10) Vs 1(0-6)	Median dif.8.5 P<0.0001

<b>Studies</b>	<b>Participants N(n1&amp;n2)</b>	<b>Outcome</b>	<b>Statistic methods</b>	<b>Result</b>	<b>Effect size</b>
<b>6) 2 ml glucose 30% Vs no treatment</b>					
Carbajal R,1999	150(25&25)	Pain score/ DANscore	Median	5(3-7) vs 7(5-10)	Median dif.2
<b>7) 2ml glucose 30% Vs 2ml placebo ( sterile water)</b>					
Bauer K,2004	58 (18&20)	Pain score/ PIPP score	Median	5.5(4-9) vs 11(7-12)	Median dif.5.5 P=0.01
Carbajal R,1999	150(25&25)	Pain score/ DAN score	Median	5(3-7) Vs 7(6-10)	Median dif. 2 P=0.005
<b>8) 2ml glucose 30% Vs pacifier (sucking)</b>					
Carbajal R,1999	150(25&25)	Pain score/ DAN score	Median	5(3-7) vs 2(1-4)	Median dif.5.5 P=0.01
<b>9) 2ml glucose 30% Vs 2ml Sucrose 30%</b>					
Carbajal R,1999	150(25&25)	Pain score/ DAN score	Median	5(3-7) Vs 5(2-8)	Median dif.0 P>0.5
<b>10) 2ml glucose 30% Vs 0.4 glucose 30%</b>					
Bauer K,2004	58(20&20)	Pain score/ PIPP score	Median	5,5(4-9) vs 7(4-11)	Median dif.1.5 P=0,01

<b>Studies</b>	<b>Participants N(n1&amp;n2)</b>	<b>Outcome</b>	<b>Statistic methods</b>	<b>Result</b>	<b>Effect size</b>
<b>11) 0.5ml glucose 30% Vs 0.5 fructose 30%</b>					
Akcam M,2004	34(34&34)	Pain score/ DAN score	Median	4.0(2-4) vs 4.0(2-5)	Median dif.0
<b>12) 0.5 ml glucose 30% Vs 0.5 ml sterile water</b>					
Akcam M,2004	34(34&34)	Pain score/ DAN score	Median	3.6±1.5 Vs 5.6±1.4	Median dif.2 P<0.001
<b>13) 0.3 ml glucose 30% Vs 0.3 ml sterile water</b>					
Carbajal R.2002	40(24&24)	Pain score/ DAN score	Median	4.5(1-6) Vs 7.0(2.59.75)	Median dif.2.5
<b>14) 0.3 ml glucose 30% Vs 0.3 ml sterile water and pacifier</b>					
Carbajal R,2002	40(15&15)	Pain score / DAN score	Median	4.6(3-6.2) Vs 3.8(2-5.5)	Median dif.0.8 P=0.4

# DISCUSSION

- Quality of the std → some bias. 3 std → performed bias, 2 std → detection bias
- 5 Std → placebo controlled
- 2 Std using 2ml glucose 30% → pain score: <6 comparable to 2ml sucrose 30%
- Effect of low dose glucose (<2ml) → variation in pain score
- **Belliani**: 1ml glucose 30% → pain score >9  
Pain score decreased → if combined with sucking or multisensorial stimulation → sensorial stimulation blocked nociceptive transmission
- **Akcam**: using 0.5ml and **Carbajal** using 0.3ml → still effective (pain score <6)
- Analgesic effect → activation of endogenous opioid

# REVIEWER'S CONCLUSION

## ■ IMPLICATION FOR PRACTICE

- \* Pain must be treated because: ethical reasons, pain caused brain damage
- \* Pharmacological treatment → rarely
- \* Low dose glucose 30% → variation in effectiveness
- \* 2 ml glucose 30% most effective as effective as sucrose 30%
- \* In present time, glucose can be as analgesic in minor painful procedure

## ■ IMPLICATION FOR RESEARCH

- \* Need to carry out studies: larger sample size, variation in dose and gestational age in developing countries
- \* Non pharmacologic treatment

**THANK YOU**
