

# Adolescent Friendly Health Services For Adolescents living with HIV

# Overview

- **Why the global focus on adolescents?**
- **ALHIV: The Current situation**
- **Three Free targets**
- **WHO recommendations across the cascade**
- **Differentiated services**
- **Resources**

# Why the global focus on adolescents living with HIV?

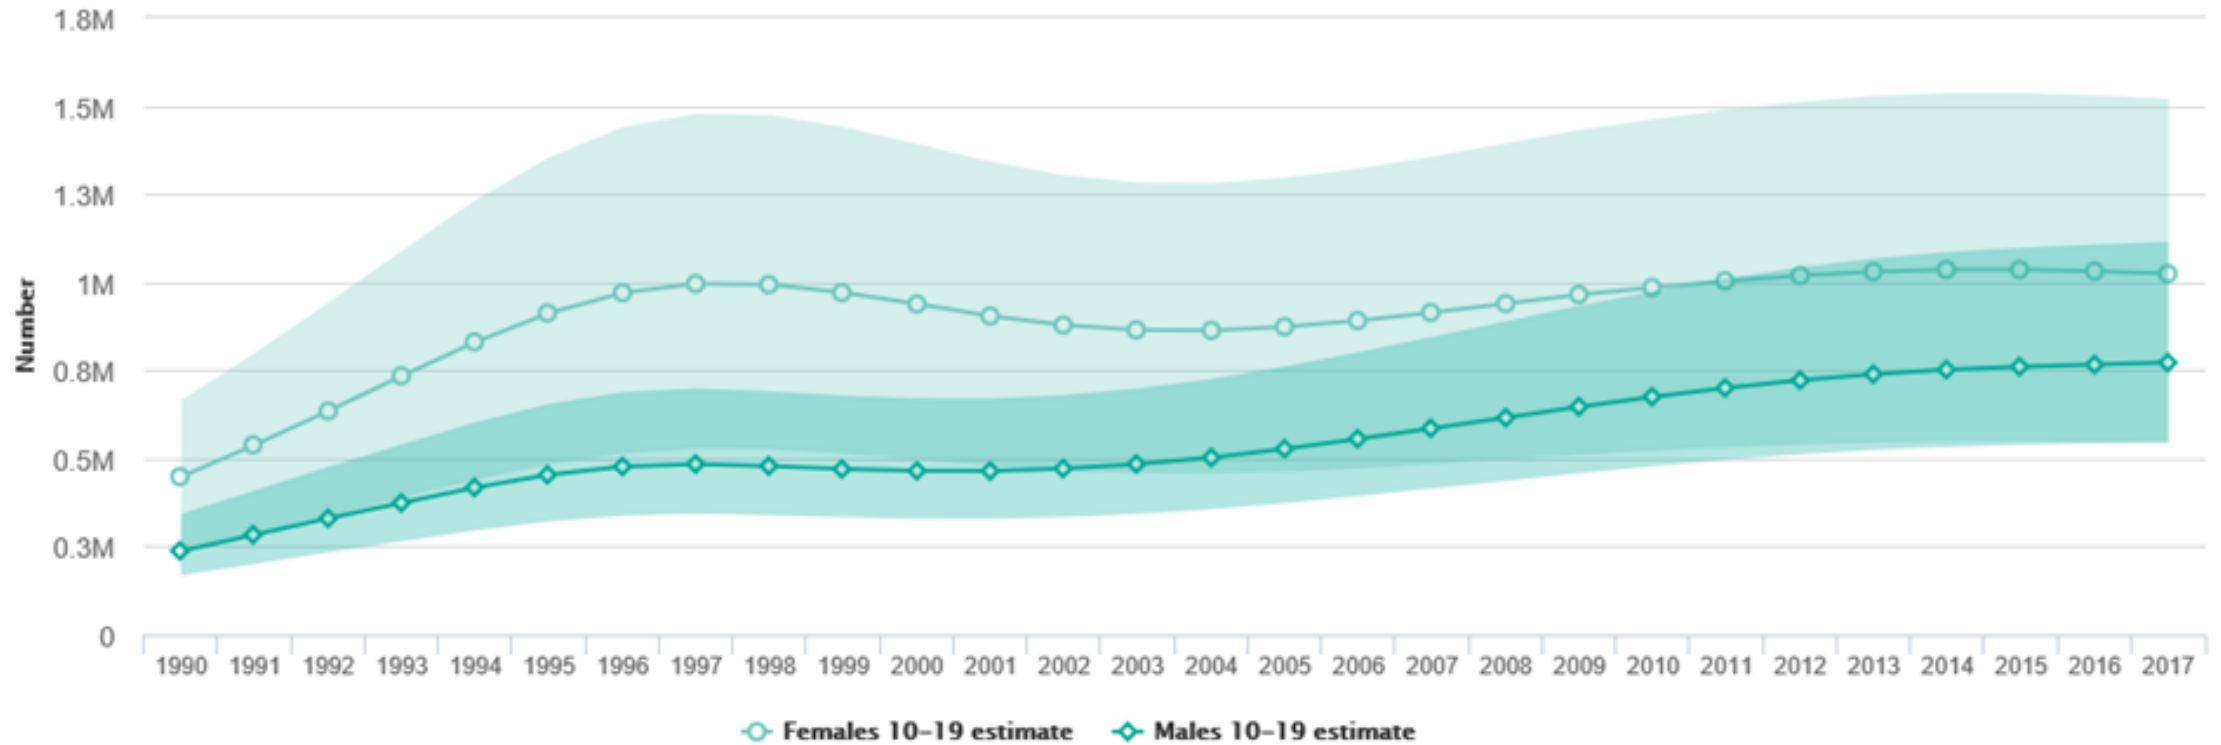

In 2017

- 1.6 million adolescents living with HIV worldwide, 61% female.
- 85 percent in sub-Saharan Africa
- 190,000 new adolescent infections globally
- 11% of the total number of new infections each year

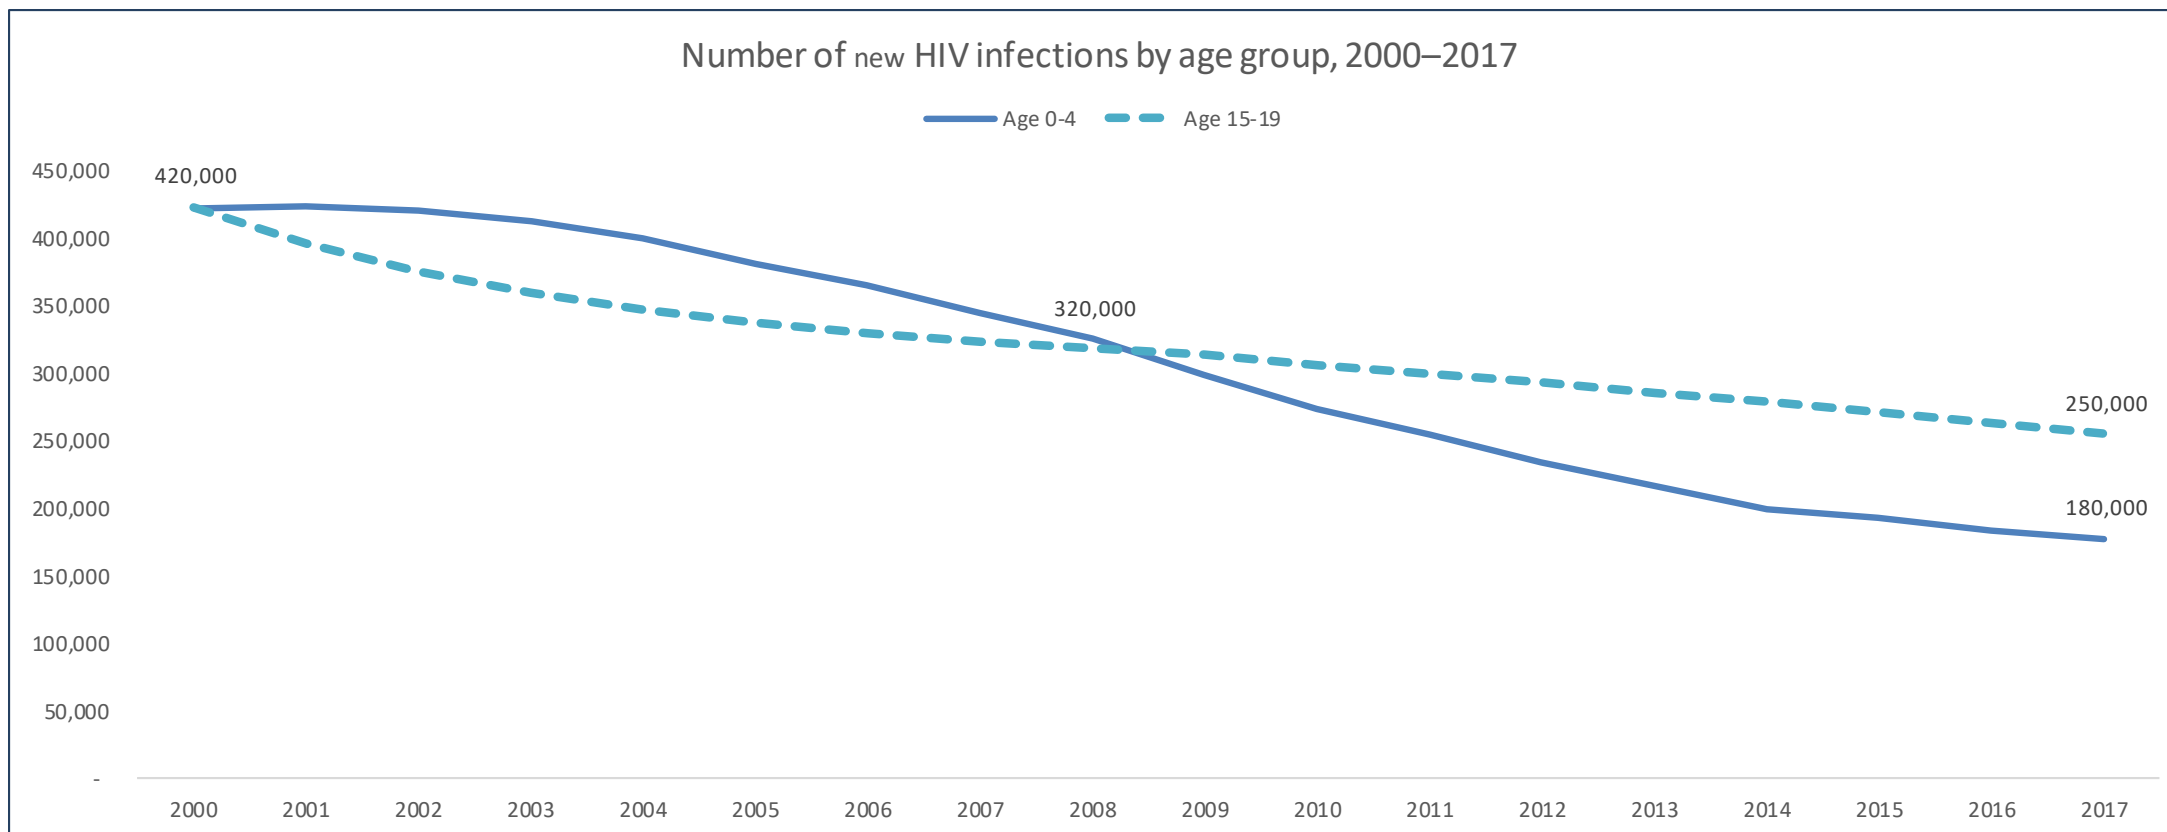

# Adolescent girls are disproportionately bearing the burden of HIV

## 1.6m ALHIV and 61% are girls

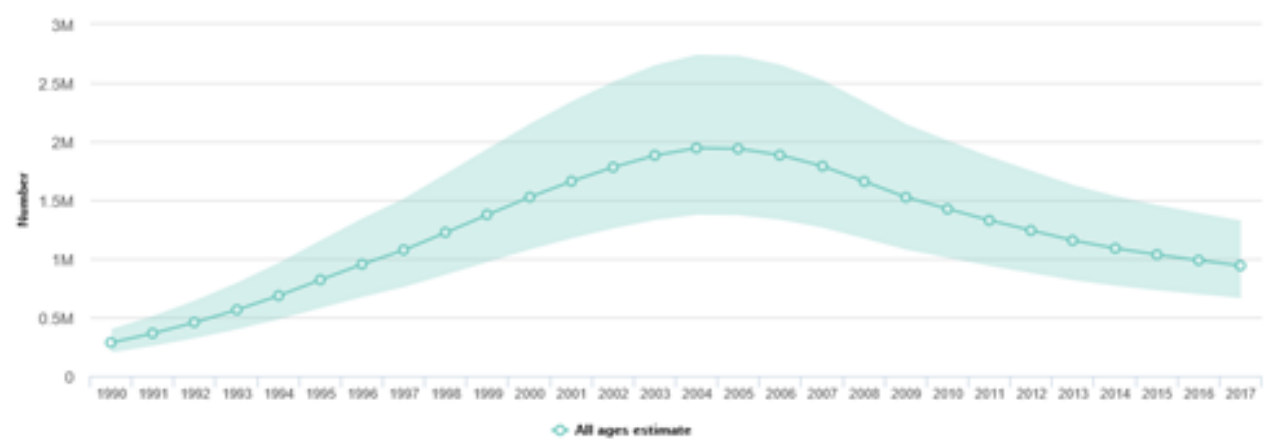

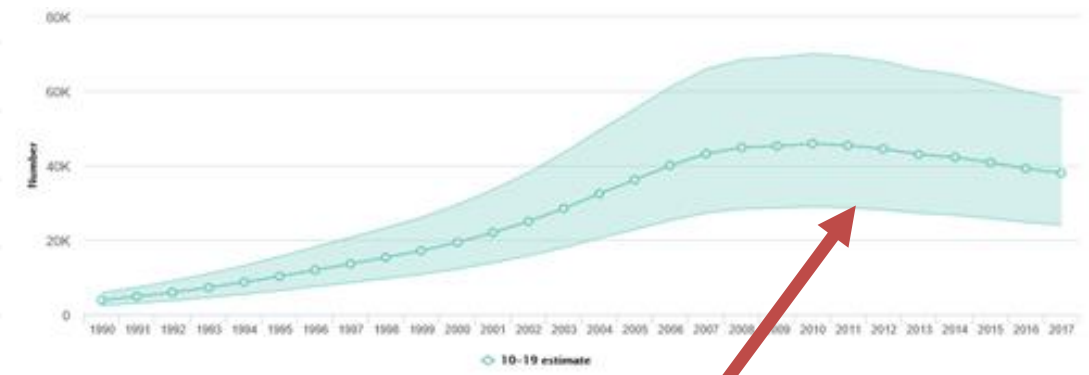

We have more to do to achieve epidemic control  
Although there are less new infections in younger children, for adolescents  
the decline has almost flatlined

# AIDS related deaths continue to decrease for all age groups

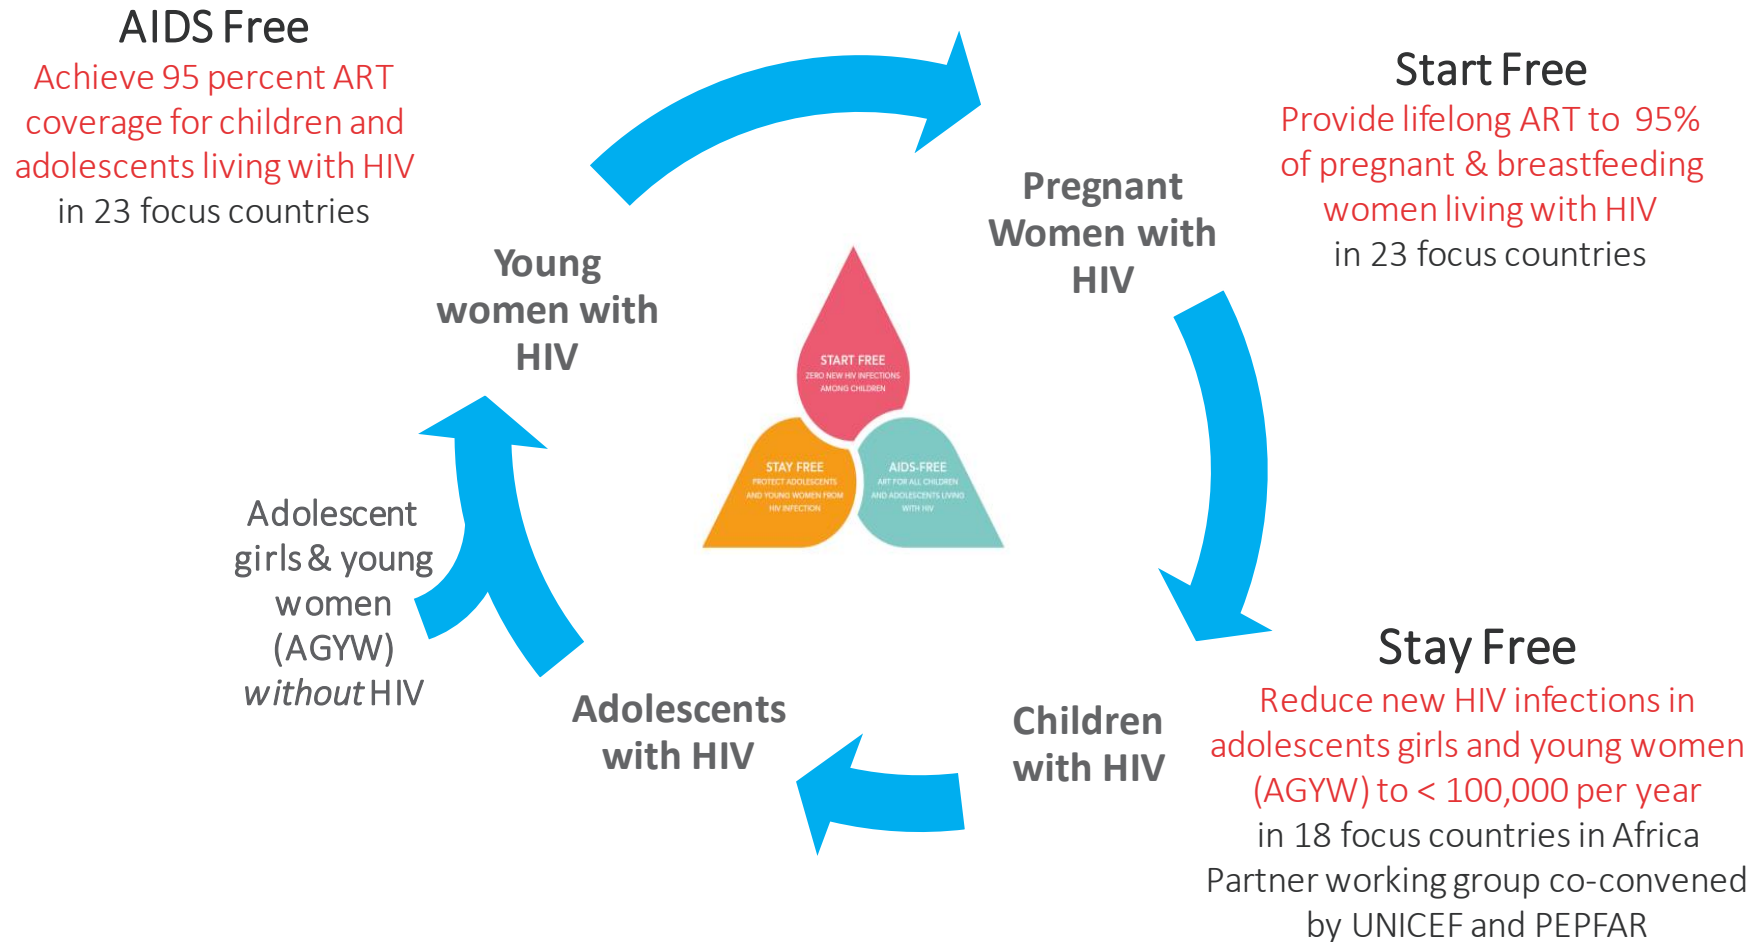

For adolescents the decline has flatlined

# Adolescents living with HIV receive inadequate access to antiretroviral therapy

Percentage of adolescents aged 10-19 living with HIV who were on ART in 2017, by age and sex, 40 countries

# Three-Frees Framework:

# Three Frees targets

*In 2016, the world committed to ambitious HIV:*

## **Prevention targets**

- a) Children (start free) - **<20,000 new infections in 2020**
- b) Adolescents & young women (stay free) - **<100,000 new infections in 2020**

## **Treatment Targets**

*Children and adolescents (AIDS Free)*

- **Provide life long HIV treatment to 95% of children and adolescents living with HIV**

***How we perform in the remaining months around adolescents and young women will drive our ability to achieve epidemic control by 2030.***

# WHO recommendations across the cascade of care

## Diagnosis

*HIV testing services, with linkages to prevention, treatment and care, should be offered for adolescents*

- From key populations in all settings
- In HIGH AND LOW prevalence HIV epidemics with a focus on yield

*Adolescents with HIV should be counselled about the potential benefits and risks of disclosure of their HIV status, and empowered and supported to determine if, when, how and to whom to disclose*

**Index case testing should be offered to all adolescents:**

- Who are orphaned
- Whose parents or siblings are living with HIV
- Whose sexual partner is living with HIV

## Linkage

*Following an HIV diagnosis, a package of support interventions should be offered to ensure timely linkage to prevention, treatment and care for all people living with HIV*

The following interventions demonstrate benefit:

1. Streamlined interventions (i) enhanced linkage with case management, (ii) support for HIV disclosure, (iii) patient tracing, (iv) training staff to provide multiple services
2. Peer support and navigation approaches
3. Quality improvement approaches using data

## Treatment

*ART should be initiated in all adolescents infected with HIV, regardless of WHO clinical stage or CD4 cell count*

Adherence support interventions

- Peer counsellors
- Mobile phone text messages
- Reminder devices
- Cognitive-behavioral therapy
- FDC and once-daily regimens

Task shifting and task sharing

- Trained and supervised lay providers can distribute ART to adults, adolescents and children living with HIV
- Trained and supervised community health workers can dispense ART between regular clinical visits

## Retention

*Programmes should provide community support for people living with HIV to improve retention in HIV care*

The following community-level interventions have demonstrated benefit in improving retention in care:

- Package of community-based interventions
- Adherence clubs
- Extra care for high-risk people

Viral load is recommended as preferred treatment monitoring approach. Routine viral load monitoring at 6 months, 12 months and then every 12 months thereafter if the patient is stable on ART

# Recommendations and Good practice statements - adolescent SRH/HIV services

WHO Consolidated guideline on sexual and reproductive health and rights of women living with HIV

**Brief sexuality-related communication (BSC) is recommended for the prevention of sexually transmitted infections among adults and adolescents in primary health services** (*Strong recommendation, low- to moderate-quality evidence*)

**GPS A.10: Health-care workers should receive appropriate recurrent training and sensitization to ensure that they have the skills, knowledge and understanding to provide services for adults and adolescents from key populations based on all persons' right to health, confidentiality and non-discrimination.**

**GPS A.11: It is recommended to make contraceptives affordable to all, including adolescents, and that law and policy support access to contraception for disadvantaged and marginalized populations.**

**GPS A.15: Countries are encouraged to examine their current consent policies and consider revising them to reduce age-related barriers to HIV services and to empower providers to act in the best interest of the adolescent.**

**GPS A.16: It is recommended that sexual and reproductive health services, including contraceptive information and services, be provided for adolescent girls without mandatory parental and guardian authorization/notification.**

# WHO service delivery recommendations

## Delivering HIV services to adolescents

### Recommendations

- Adolescent-friendly health services should be implemented in HIV services to ensure engagement and improved outcomes (strong recommendation, low-quality evidence).
- Community-based approaches can improve treatment adherence and retention in care of adolescents living with HIV (conditional recommendation, very low-quality evidence).
- Training of health-care workers can contribute to treatment adherence and improvement in retention in care of adolescents living with HIV (conditional recommendation, very low-quality evidence).
- Adolescents should be counselled about the potential benefits and risks of disclosure of their HIV status to others and empowered and supported to determine if, when, how and to whom to disclose (conditional recommendation, very low-quality evidence).

# Adolescent and young key Populations

- Populations at higher risk of HIV including sex workers, men who have sex with men (MSM), transgender people, and people who inject drugs (IDU) and People in prisons and other closed settings
- Adolescent key populations are more vulnerable than adults in the same groups, with many risks and vulnerabilities

In Asia, 95% of the young people living with HIV are also part of a key affected populations.

In Asia, 95% of young people diagnosed with HIV fall into at least one of these most affected groups:
